SAFETY SUMMARY

GENERAL SAFETY NOTICES

The following general safety notices supplement the specific warnings and cautions appearing elsewhere in this manual. They are recommended precautions that must be understood and applied during operation and maintenance of the equipment covered herein. The general safety notices are presented in the following three sections labeled: First Aid, Operating Precautions and Maintenance Precautions. A listing of the specific warnings and cautions appearing elsewhere in the manual follows the general safety notices.

FIRST AID
An injury, no matter how slight, should never go unattended. Always obtain first aid or medical attention immediately.

OPERATING PRECAUTIONS
Always wear safety glasses.
Keep hands clear of the evaporator blower and condenser fan.
No work should be performed on the unit until all circuit breakers and start-stop switches are turned off, and power supply is disconnected.
Always work in pairs. Never work alone.
In case of severe vibration or unusual noise, stop the unit and investigate.

MAINTENANCE PRECAUTIONS
Beware of unannounced starting of the evaporator blower & condenser fan. Do not remove the ceiling grill assembly or the upper unit cover assembly before turning the power off, and disconnecting the power supply. Before disconnecting, discharge capacitors by shorting across the capacitors terminals. (See Paragraph 3.5.8)
When disassembling wiring, use numbered stickers to identify wire leads and terminals. This aids in quick, accurate reassembly.
Be sure power is turned off before working on motors, controllers, or electrical control switches. Tag any circuit breakers and power supply to prevent accidental energizing of circuits.
Do not bypass any electrical safety devices, e.g. bridging an overload, or using any sort of jumper wires. Problems with the system should be diagnosed and any necessary repairs must be performed by qualified service personnel.
In case of electrical fire, open circuit switch and extinguish with CO₂ (never use water).
Use dry nitrogen to pressurize the system for leak checking. Be careful not to exceed 150 psig test pressure in the hermetic compressor.
Coil fins are sharp. Use care when removing the cover form the base pan to avoid personal injury.
Oil vapor in piping stubs can ignite from torch flame and cause serious injury. Exercise extreme care when brazing, and keep brazing cloth and fire extinguisher handy for emergency use.
Disconnect power to the AirV unit before checking the capacitor.
SPECIFIC WARNING AND CAUTION STATEMENTS
The statements listed below are applicable to the refrigeration unit and appear elsewhere in this manual. These recommended precautions must be understood and applied during operation and maintenance of the equipment covered herein.

SPECIFIC WARNINGS AND CAUTIONS

⚠️ WARNING

Be sure to observe warnings listed in the safety summary in the front of this manual before performing maintenance on the AirV system.

⚠️ WARNING

Before working on the unit be sure to first disconnect all electric power to the unit to avoid the possibility of electrical shock and personal injury. Before disconnecting, discharge capacitors by shorting across the capacitors terminals (Refer to paragraph 3.5.8)

⚠️ WARNING

Shield coils with cardboard to protect hands against injury from sharp metal edges when removing compressor and other components.

⚠️ WARNING

Oil vapor in piping stubs can ignite from torch flame and cause serious injury. Exercise extreme care when brazing, and keep brazing cloth and fire extinguisher handy for emergency use.

⚠️ WARNING

Disconnect power to the AirV unit before checking the capacitor.

⚠️ WARNING

Do not touch the metal of the screwdriver when discharging the capacitor. You could receive a shock.

⚠️ WARNING

Before installing thermostat, turn off all power to unit. There may be more than one power disconnect. Electrical shock can cause personal injury or death.

⚠️ CAUTION

Do not use carbon tetrachloride, solvents, or waxes containing solvents to clean plastic sections.
CAUTION

Coil fins are sharp. Use care when removing the cover from the base pan to avoid personal injury.

CAUTION

The change from Fahrenheit to Celsius will be permanent. It cannot be changed back to Fahrenheit.

CAUTION

When re-assembling, ensure the battery springs are correctly placed in the battery spring holders.

CAUTION

Improper wiring or installation may damage thermostat. Wiring must conform to local and national electrical codes.

SECTION 1  
DESCRIPTION

1.1 INTRODUCTION
This manual contains service instructions and electrical data for the AirV, Carrier Transport Air Conditioning’s Recreational Vehicle air conditioning unit.

The AirV units are two piece systems, consisting of the Upper Unit and the Ceiling unit. The Upper Unit contains the refrigeration system while the Ceiling Unit contains the controls and vents. The Ceiling Units are available in a free–blow or ducted configuration.

The free–blow units (see Figure 1-2) deliver air to the vehicle by means of front and rear end vents and one downward vent (air shower). The vents may all be opened or closed to direct air as desired. The front and rear vents are fitted with motorized dampers that oscillates to produce an “air-sweep” effect. These units may be fitted with optional electric heat.

The ducted units (see Figure 1-5 and Figure 1-6) deliver air through ducting built in the vehicle ceiling. These units are fitted with a 12 VDC microprocessor control system, a display panel (PCB display) and a remote controller. These units may be wired to provide thermostatic control of the vehicle furnace.

Carrier’s AirV air conditioning models include cooling only units, heating/cooling units, and heat pump units. The cooling only units are available with free blow or ducted air delivery. Cooling units with heat strips are available for free blow only.

Operation of the AirV units is controlled automatically by the temperature controller (thermostat), which maintains the vehicle’s interior temperature at the desired set point. Free Blow, cool-only units are available with a wall mounted thermostat.

Table 1-1 lists model numbers and descriptions of the AirV units, and Table 1-2 lists additional support manuals that are available.

1.2 SERIAL NUMBER IDENTIFICATION
Separate part numbers and serial numbers are provided for the upper and lower unit assemblies. The numbers may be found on a plate readable from inside the vehicle, See Figure 1-7.

The first two numbers of the serial number, see Figure 3-22, is the week the unit was manufactured. For example, 01 would designate the first week of the year and 52 would designate the last week of the year.

The third and fourth numbers designate the year in which the unit was manufactured. For example, 99 would represent the year 1999, 00 the year 2000, and so on.

The letter Y and all the numbers after it designates the unit serial number. Example: Y43210

A serial number of 1303Y12345 designates that the unit was manufactured the 13th week of 2003 and the serial number is Y12345.

1.3 DESIGN CHANGE DESCRIPTIONS
The following list provides a description of changes in design and serial number breaks for those changes.

1400Y A diode was added to the Ducted Ceiling assembly control board to stop DC ripple from the converters.

2900Y Cover screw coating was changed in order to eliminate corrosion.

3400Y The plastic shroud was modified to improve drainage.

5100Y A new compressor and capacitor is introduced, improving stability and increasing capacity.

1201Y The temperature sensor was moved to the grill to improve temperature sensing during furnace mode.

2501Y The dual air sweep was added.

4501Y A switch was added to skip compressor malfunction test.

4601Y Change in material was made in order to strengthen the fan propeller.

4901Y The mounting bolt lengths were increased 3/4 inch.

4901Y The polar white ducted ceiling color was cut-in.

0703Y & 1903Y New style PCB – Cool Mode – Control & Power Assembly (Fans shut off in auto mode).

0803Y & 2603Y New style PCB – Heat Pump – Control & Power Assembly (Fans shut off in auto mode).

4204Y Minimum furnace setpoint lowered from 63°F to 45°F.

1.6 REFRIGERANT CYCLE - STANDARD SYSTEM

The cooling cycle is energized when the thermostat, located on the ceiling unit, calls for cooling. The main components of the system are the compressor, air-cooled condenser coil, strainer, capillary tube, evaporator coil, and accumulator.

The compressor raises the pressure and the temperature of the refrigerant and forces it through the discharge line into the condenser coil. (See Figure 1-8.)

The condenser fan circulates surrounding air (which is at a temperature lower than the refrigerant) over the outside of the coil tubes. Heat transfer is established from the refrigerant (inside the tubes) to the air (flowing over the tubes). The tubes have fins designed to improve the transfer of heat from the refrigerant gas to the air. This removal of heat causes the refrigerant to liquefy, thus liquid refrigerant leaves the coil and flows through a strainer to the capillary tube. The strainer removes any impurities within the refrigerant system.

The capillary tube meters the flow of liquid refrigerant to the evaporator coil. As the refrigerant flows through the capillary tube, there is a reduction in pressure and temperature.

The evaporator blower (fan) pulls vehicle air through the filters, which remove particulate matter, and then pass the cleaned air through the evaporator coil.

The low pressure, low temperature liquid that flows into the evaporator coil tubes is colder than the air that is circulated over the tubes. Heat transfer is established from the vehicle air (flowing over the tubes) to the evaporator coil (flowing inside the tubes). The evaporator coil tubes have aluminum fins to increase heat transfer from the air to the refrigerant; therefore the cooler air is circulated to the interior of the vehicle.

The transfer of heat from the air to the low temperature liquid refrigerant in the indoor coil causes the liquid to vaporize. This low temperature, low pressure vapor passes into the accumulator. The accumulator is designed with the inlet tube delivering refrigerant to the bottom of the tank and the outlet tube taking refrigerant from the top of the tank. This arrangement ensures that only vapor refrigerant is returned to the compressor, where the cycle repeats.

When ventilation only is selected, the indoor fan functions to circulate air throughout the vehicle. The refrigerant cycle will remain off.

Figure 1-8 Refrigerant Flow Schematic (Standard System)
1.7 REFRIGERANT CYCLE - HEAT PUMP

1.7.1 Cooling

The cooling cycle is energized when the thermostat, located in the ceiling unit, calls for cooling. The system controls are positioned for “normal” refrigerant flow, with the compressor discharge delivered to the outdoor coil and liquid delivered to the indoor coil. (See Figure 1-9.)

The main components of the system are the compressor, reversing valve, air-cooled outdoor coil, strainer, capillary tube, indoor coil, and the accumulator.

The compressor raises the pressure and the temperature of the refrigerant and forces it through the discharge line and reversing valve into the outdoor coil.

The outdoor fan circulates surrounding air (which is at a temperature lower than the refrigerant) over the outside of the coil tubes. Heat transfer is established from the refrigerant (inside the tubes) to the outdoor air (flowing over the tubes). The tubes have fins designed to improve the transfer of heat from the refrigerant gas to the air; this removal of heat causes the refrigerant to liquify, thus liquid refrigerant leaves the coil and flows through the strainer to the capillary tube. The strainer removes any impurities within the refrigerant system.

The capillary tube meters the flow of liquid refrigerant to the indoor coil. As the refrigerant flows through the capillary tube, there is a reduction in pressure and temperature.

The indoor blower (fan) pulls inside air through the filters, which remove particulate matter, and then pass the cleaned air through the indoor coil.

The low pressure, low temperature liquid that flows into the indoor coil tubes is colder than the air that is circulated over the tubes. Heat transfer is established from the indoor air (flowing over the tubes) to the refrigerant (flowing inside the tubes). The indoor coil tubes have aluminum fins to increase heat transfer from the air to the refrigerant; therefore, the cooler air is circulated to the interior of the vehicle.

The transfer of heat from the air to the liquid refrigerant in the indoor coil causes the liquid to vaporize. This low temperature, low pressure vapor passes into the accumulator. The accumulator is designed with the inlet tube delivering refrigerant to the bottom of the tank and the outlet tube taking refrigerant from the top of the tank. This arrangement ensures that only vapor refrigerant is returned to the compressor, where the cycle repeats.

When ventilation only is selected, the indoor fan functions to circulate air throughout the vehicle. The refrigerant cycle will remain off.
1.7.2 Heating

The heating cycle is energized when the thermostat, located in the ceiling unit, calls for heat. The system controls are positioned for "reverse" refrigerant flow, with the compressor discharge delivered to the indoor coil and liquid delivered to the outdoor coil. (See Figure 1-10.)

The main components of the system are the compressor, reversing valve, indoor coil, capillary tube, strainer, air-cooled outdoor coil, and the accumulator.

The compressor raises the pressure and the temperature of the refrigerant and forces it through the discharge line and reversing valve into the indoor coil.

The indoor blower (fan) pulls inside air through the filters, which remove particulate matter, and then pass the cleaned air through the indoor coil.

The vehicle air (which is at a temperature lower than the refrigerant) passes over the outside of the coil tubes. Heat transfer is established from the refrigerant (inside the tubes) to the vehicle air (flowing over the tubes). The tubes have fins designed to improve the transfer of heat from the refrigerant gas to the air; this removal of heat causes the refrigerant to liquefy, thus liquid refrigerant leaves the coil and flows through the strainer to the outdoor coil. The strainer removes any impurities within the refrigerant system.

The capillary tube meters the flow of liquid refrigerant to the outdoor coil. As the refrigerant flows through the capillary tube, there is a reduction in pressure and temperature.

The low pressure, low temperature liquid that flows into the outdoor coil tubes is colder than the outdoor air that is circulated over the tubes. Heat transfer is established from the outdoor air (flowing over the tubes) to the refrigerant (flowing inside the tubes). The outdoor coil tubes have aluminum fins to increase heat transfer from the air to the refrigerant.

The transfer of heat from the air to the low temperature liquid refrigerant in the outdoor coil causes the liquid to vaporize. This low temperature, low pressure vapor passes into the accumulator. The accumulator is designed with the inlet tube delivering refrigerant to the bottom of the tank and the outlet tube taking refrigerant from the top of the tank. This arrangement ensures that only vapor refrigerant is returned to the compressor, where the cycle repeats.

When ventilation only is selected, the indoor fan functions to circulate air throughout the vehicle. The refrigerant cycle will remain off.

**Clearing Diagnostic Alarms**

When a repair has been accomplished due to a corresponding alarm, the alarm must be cleared. This is done by disconnecting the 12 VDC power to the ducted ceiling assembly for one or two seconds. Once the 12 VDC power is reconnected, the alarm should have been cleared.

SECTION 3
SERVICE AND MAINTENANCE

3.1 PREVENTATIVE MAINTENANCE

**Cleaning**—Clean evaporator coil and condenser coil. Hold flashlight behind coil to see if all spaces are clear. Dust accumulation obstructs or reduces airflow and results in loss of cooling capacity. Both coils may be vacuumed when dry. Coils may also be brushed with a stiff brush and then blown out with compressed air.

Thoroughly clean base pan, motors, fan wheels, and other components.

Clean cover and ceiling grill. Mild detergents reduce electrostatic charges on plastic sections of the grill and are good cleaners.

**CAUTION**

Do not use carbon tetrachloride, solvents, or waxes containing solvents to clean plastic sections.

**Painting**—Paint any parts that show evidence of rust with a good rust-prevention paint.

**Wiring**—Check all wiring for deterioration and all electrical contacts for tightness or corrosion.

**Mounting**—Make sure unit is secure on roof according to installation instructions provided in Owner’s Guide. Check fans to insure that they are correctly positioned in the center of the orifice, and tight on the shaft.

**Leaks**—Check any connections that show evidence of oil or leaks. When unit is properly installed (refer to Owner’s Guide) check gaskets for possible air leakage.

**Controls**—Check unit to ensure all controls are functioning correctly and unit operation is normal. Vibrations can cause unwanted noise.

**NOTE**

Check to ensure that piping is not vibrating against side of the unit.

**NOTE**

For proper cleaning and flushing, use a UL approved refrigerant recovery/recycling system.

**NOTE**

Refrigerant removal must always include recovering the refrigerant, not allowing it to escape to the atmosphere.

3.2 SERVICE - GENERAL

**General Notes**—These Service Instructions are provided to assist the trained and qualified Carrier service technician in repairing or replacing components of the AirV units.

---

**WARNING**

Before working on the unit be sure to first disconnect all electric power to the unit to avoid the possibility of electrical shock and personal injury. Before disconnecting, discharge capacitors by shorting across the capacitors terminals (Refer to paragraph 3.5.8)

Shield coils with cardboard to protect hands against injury from sharp metal edges when removing compressor and other components.

3.3 CEILING UNIT - FREE BLOW SYSTEMS

3.3.1 Filter Removal

The filters (Figure 3-1) are located in the ceiling grill. To remove the filters, do the following:

a. Grasp the edge of the filter at recess in the end of the ceiling grill.

b. Pull filter completely out of the filter slot.

c. Vacuum filter or wash filter in luke-warm water. Shake off excess water and dry thoroughly.

d. Replace filter by sliding the filter into the filter slot in the ceiling grill until the filter frame is flush with the interior grill.

**NOTE**

For proper cleaning and flushing, use a UL approved refrigerant recovery/recycling system.

3.3.2 Ceiling Grill Removal

To remove the ceiling grill (Figure 3-2) do the following:

a. Before working on unit place the master switch in the OFF position and disconnect all electrical power.

b. Remove 4 screws located on the ceiling grill, making sure to support the weight of the grill.

c. Lower the ceiling grill from the ceiling panel.
d. To replace the grill, place the grill up against the ceiling panel and align the screw holes in the grill with the ceiling panel.

e. Replace 4 screws.

**Figure 3-2 Ceiling Grill - Free Blow**

### 3.3.3 Ceiling Panel Removal

To remove the ceiling panel (Figure 3-3) do the following:

a. Remove the ceiling grill. (Refer to paragraph 3.3.2.)

b. Remove 5 screws securing the duct plate to the ceiling panel.

c. Remove 4 mounting bolts making sure to support the weight of the ceiling panel.

d. Disconnect the unit harnesses and main power wires from the ceiling panel.

e. Lower the ceiling panel from the air conditioning unit.

f. Reverse above procedure for reassembly.

**Figure 3-3 Ceiling Panel Assembly**

#### 3.3.4 Master Control Switch

To remove the master control switch, do the following:

a. Remove ceiling grill. (Refer to paragraph 3.3.2.)

b. Remove 5 screws that secure the control assembly (Item 2, Figure 1-3) to the control box cover.

c. Remove the master control switch knob by grabbing the outside edge of the knob and pulling it off of the switch stem.

d. Remove 2 screws securing the master control switch to the control assembly.

e. Carefully disconnect wires from the master control switch. Label wires to aid in reassembly.

f. Reverse above procedure for reassembly.

**Figure 3-5 Control Box Assembly - Free Blow**

#### 3.3.5 Air Sweep Switch Removal

To remove the air sweep switch, do the following:

a. Remove ceiling grill. (Refer to paragraph 3.3.2.)

b. Remove 5 screws securing the control assembly (Item 2, Figure 1-3) to the control box cover.

c. Disconnect wires from the air sweep switch.

d. Pinch tabs on either end of the switch and slide out of lower control box cover.

e. Reverse above procedure for reassembly.
3.3.6 Indoor Thermostat Removal
To remove the indoor thermostat (Figure 3-6) do the following:
   a. Remove ceiling grille. (Refer to paragraph 3.3.2.)
   b. Remove 5 screws securing the control assembly (item 3, Figure 1-3) to the control box cover.
   c. Remove the indoor thermostat knob by grabbing the outside edge of the knob and pulling it off of the thermostat stem.
   d. Remove 2 screws that secure the indoor thermostat to the lower control box cover.
   e. Carefully disconnect the 2 wires from the indoor thermostat.
   f. Remove the sensing bulb from the plastic clip.
   g. Carefully slide the sensing bulb through the rubber grommet.
   h. Remove the thermostat from the control assembly.
   i. Reverse above procedure for reassembly.

3.3.7 Air Sweep Removal
To remove the air sweep, do the following:
   a. Remove ceiling grille. (Refer to paragraph 3.3.2.)
   b. Remove cam (See Figure 3-3) from air sweep motor shaft.
   c. Remove 4 screws securing air sweep motor bracket to the ceiling panel assembly.
   d. Carefully disconnect air sweep motor wire terminations.
   e. Remove 2 screws securing air sweep motor (Figure 3-7) to control box and remove motor.
   f. Reverse above procedure for reassembly.

3.3.8 Heat Strip Assembly Removal
To remove the heat strip assembly (Figure 3-8) do the following:
   a. Remove ceiling grille. (Refer to paragraph 3.3.2.)
   b. Unplug electrical connection at air sweep motor assembly.
   c. Remove two screws securing heat strip assembly to the ceiling panel assembly.
   d. Slide heat strip assembly away from air sweep motor assembly and pull down, easing the electrical connection through the access hole.
   e. Reverse the procedures for reassembly.
3.4 CEILING UNIT - DUCTED SYSTEMS

3.4.1 Filter Removal
The filters (Figure 3-9) are located in the ceiling grill. To remove the filters, do the following:

a. Grasp the edge of the filter at recess in the end of the ceiling grill.
b. Pull filter completely out of the filter slot.
c. Vacuum filter or wash filter in luke-warm water. Shake off excess water and dry thoroughly.
d. Replace filter by sliding the filter into the filter slot in the ceiling grill until the filter frame is flush with the interior grill.

3.4.2 Ceiling Grill Removal
To remove the ceiling grill (Figure 3-10) do the following:

a. Before working on unit place the master switch in the OFF position and disconnect all electrical power.
b. Remove filters (Refer to paragraph 3.4.1).
c. Remove 4 screws located on the ceiling grill, (two are under the filters) making sure to support the weight of the grill.
d. Lower the ceiling grill from the ceiling panel.
e. To replace the grill, place the grill up against the ceiling panel and align the screw holes in the grill with the ceiling panel.
f. Replace 4 screws and 2 filters.

3.4.3 Control Box Assembly Removal
To remove the control box assembly (Figure 3-11 & Figure 3-12) do the following:

a. Remove ceiling grill. Refer to paragraph 3.4.2.
b. Disconnect 115 volt (AC) and 12 volt (DC) power wires.
3.4.4 Main PCB Board Removal
To remove the Main PCB board (Figure 3-13) do the following:
a. Remove ceiling grill. Refer to paragraph 3.4.2.
b. Remove three screws securing the PCB cover to the ducted ceiling unit.
c. Carefully turn over the PCB cover exposing the PCB main and the PCB display assemblies.
d. Gently push holding clip away from PCB main assembly.
e. Lift PCB main assembly from PCB cover assembly.
f. Unplug display wiring plug #4. Figure 3-13
g. Unplug thermistor/thermostat wiring plug #3. Figure 3-13
h. Unplug power wiring plug #1. Figure 3-12
i. Unplug signal wiring plug #2. Figure 3-12
j. Reverse above procedures for reassembly.

3.4.5 PCB Display Removal
To remove the PCB display assembly (Figure 3-13) do the following:
a. Remove ceiling grill. Refer to paragraph 3.4.2.
b. Push large clip away from PCB display assembly.
c. Push center clip towards large clip.
d. Pull PCB display assembly from PCB cover.
e. Unplug display wiring from PCB main assembly.
f. Reverse above procedures of reassembly.

3.4.6 Fuse Removal
To remove the fuse (Figure 3-11) do the following:
a. Remove ceiling grill. Refer to paragraph 3.4.2.
b. Turn fuse holder in direction of arrow (counter-clockwise).
c. Pull fuse from fuse holder.
d. Test and/or replace.
e. Reverse above procedures for reassembly.

3.5 SERVICE - UPPER UNIT - STANDARD, HC & HP
3.5.1 Exterior Cover Removal

Coil fins are sharp. Use care when removing the cover from the base pan to avoid personal injury.

To remove the exterior cover, do the following:
a. Before working on unit place the master switch in the OFF position and disconnect all electrical power.
b. Remove 15 screws securing the unit cover to the base pan assembly. See Figure 3-14.
c. Carefully lift the exterior cover off of the unit base pan assembly.
d. Reverse above procedure for reassembly.
3.5.2 Compressor Replacement
Observe the same procedures for rotary compressors as for reciprocating compressors.
a. Follow all safety codes. Reminder: use protective goggles, work gloves, and water soaked quenching cloth.
b. Remove exterior cover. Refer to paragraph 3.5.1. Disconnect all wiring from the compressor.
c. Apply field-supplied, line-tap-valves to the suction and discharge lines as close to the compressor as possible.
d. Recover the refrigerant charge from the unit. After recovering, cut the discharge and suction line process tubes below the tube crimps. If you choose a good tubing location for cutting the refrigeration lines initially, the location is easily accessible when making the final joints.

**WARNING**
Oil vapor in piping stubs can ignite from torch flame and cause serious injury. Exercise extreme care when brazing, and keep brazing cloth and fire extinguisher handy for emergency use.

e. Connect a nitrogen supply to the unit at one of the line-tap-valve connectors (5-psig maximum flow), leaving the other connector open to the atmosphere. Brazed angle valves with stubs to each process tube.
f. Remove compressor from unit (3 bolts).
g. Remove line-tap-valves from suction and discharge lines. Carefully braze the holes closed from where the line-tap-valves were removed.
h. Clean system: add or replace liquid line filter drier. For proper cleaning and flushing use a UL approved refrigerant recycling system.
i. Install new compressor and braze into place with field-supplied copper slip couplings.
j. Connect wiring: replace wire terminals if necessary.
k. Proceed with evacuation and charging (15.9 OZ. = .45 KG R22). Pinch off lines where angle valves were added. Cut off angle valves above pinch-off, and braze tubes.
l. Start up unit.

3.5.3 Control Box Assembly Removal
To remove the control box assembly, do the following:
a. Remove exterior cover assembly. Refer to paragraph 3.5.1.
b. Remove 2 screws securing control box assembly to the lower scroll assembly. (See Figure 3-15.)

c. Slide control box out of the lower scroll assembly. (See Figure 3-16.)
d. To open control box remove 2 screws securing the water cover to the control box cover.
e. Gently lift the water cover off of the control box. (See Figure 3-17.)
f. Reverse above procedure for reassembly.
3.5.4 Upper Scroll Assembly Removal
a. Remove exterior cover assembly. Refer to paragraph 3.5.1.
b. Remove 4 screws securing upper scroll assembly to the lower scroll assembly. (See Figure 3-18)
c. Gently pry 4 snap clips open and lift the upper scroll assembly off of the lower scroll assembly.
d. Reverse above procedure for reassembly.

3.5.5 Motor Assembly and Condenser Fan Removal
a. Remove exterior cover assembly. Refer to paragraph 3.5.1.
b. Remove control box assembly. Refer to paragraph 3.5.3.
c. Remove upper scroll assembly. Refer to paragraph 3.5.4.
d. Remove 4 screws securing the condenser cover to the condenser orifice. (See Figure 3-24.)
e. Carefully disconnect motor wire terminations from within the control box.
f. Remove 1 screw securing the motor ground lead to the motor bracket assembly. (See Figure 3-19)
g. Using flat-nosed pliers, depress the motor spring clamp and slide it off of the condenser fan (See Figure 3-20).
h. Lift and slide motor towards evaporator coil to remove condenser fan from the motor shaft.
i. Remove condenser fan from motor shaft and lift fan out through the top of the condenser orifice. (See Figure 3-22)
j. Remove motor assembly.
k. Reverse above procedure for reassembly.

Figure 3-18 Upper Scroll Assembly

Figure 3-19 Motor Assembly

Figure 3-20 Spring Clamp Removal

Figure 3-21 Motor Clip Removal
3.5.6 Evaporator Blower Wheel Adjustment or Removal

a. Remove exterior cover assembly. Refer to Exterior Cover Assembly Removal instructions 3.5.1.
b. Remove control box assembly. Refer to Control Box Assembly Removal instructions 3.5.3.
c. Remove upper scroll assembly. Refer to Upper Scroll Assembly Removal instructions 3.5.4.
d. Loosen motor assembly. Refer to Motor Assembly Removal instructions 3.5.5.
e. Mark shaft at a point where wheel hub and motor shaft meet to aid in reassembly. (See Figure 3-23.)
f. Remove 1 set screw holding the blower wheel to the motor shaft. (See Figure 3-23)
g. Slide off blower wheel from motor shaft.
h. Reverse above procedure for reassembly.

3.5.7 Air Handling System Removal

a. Remove exterior cover assembly. Refer to paragraph 3.5.1.
b. Remove control box assembly. Refer to paragraph 3.5.3.
c. Remove upper scroll assembly. Refer to paragraph 3.5.4.
d. Remove motor assembly. Refer to paragraph 3.5.5.
e. Remove 8 screws securing lower scroll assembly to the base pan assembly.
f. Remove 1 screw from clamp securing suction tube to the base pan assembly.
g. Remove 3 nuts securing the compressor to the base pan assembly.
h. Remove 2 screws securing the condenser orifice to the base pan assembly.
i. Remove 2 screws securing the condenser coil assembly to the base pan assembly.
j. Carefully lift the entire assembly off of the base pan assembly.
k. Reverse the above procedure for reassembly, ensuring that the air handling system is positioned correctly. Tighten all screws.
3.5.8 Capacitor Troubleshooting

**WARNING**

Disconnect power to the AirV unit before checking the capacitor.

To test capacitor to determine if good, open or shorted, an ohm meter can be used. To determine a capacitor’s capacitance, a capacitor meter is required.

Capacitors showing signs of leaks or bulging should be replaced immediately.

3.5.9 Capacitor Testing and Replacement

Capacitors must be discharged properly before testing.

a. Place a 20,000 ohm, 2 watt resistor across the terminals of the capacitor for approximately 30 seconds (See Figure 3-25 for a suggested tool).

**WARNING**

Do not touch the metal of the screwdriver when discharging the capacitor. You could receive a shock.

b. After the capacitor has been discharged and all wires removed from the capacitor terminals, use an ohmmeter to test its resistance.

c. Set the scale to R x 1K or 10K ohm and place the ohmmeter leads across the capacitor terminals.

d. If the ohmmeter first reads 0, then rises toward infinity or some higher resistance, the capacitor is good.

e. If the ohmmeter goes to 0 or a low resistance and stays there, the capacitor is shorted and needs to be replaced.

f. If the ohmmeter reads infinity (OL) the capacitor is open and needs to be replaced.

![Figure 3-25 Set-Up For Discharging a Capacitor](image)

3.5.10 Positive Temperature Coefficient Thermister (PTC) (Start Thermistor) Troubleshooting

a. Disconnect power from the AirV unit.

b. Disconnect the wires to the PTC.

c. Using an ohm meter, check for continuity across the PTC.

If the PTC does not have continuity, it must be replaced. If continuity exists, reconnect the wires to the PTC.

d. Reconnect power to the AirV unit.

e. Turn on the AirV unit to start.

f. Use a clamp-on amp probe to monitor the amp draw of the compressor during its start-up.

When the compressor starts, an amp draw will be indicated for almost a second.

If no amp draw is indicated or if the amp draw occurs for much longer than a second, the PTC is defective and must be replaced.

3.5.11 Line Voltage - 10%

Line voltage should be checked during peak electrical load periods.

With the AirV unit on and the compressor operating, use a voltmeter to check the voltage being supplied to the AirV unit. The voltage must be within 10% of the units required voltage. A voltage drop greater than 10% will cause a premature compressor failure and needs to be corrected immediately.
3.6 SERVICE - UPPER UNIT - LOW PROFILE

3.6.1 Exterior Cover Removal

**CAUTION**

Coil fins are sharp. Use care when removing the cover form the base pan to avoid personal injury.

To remove the exterior cover, do the following:

a. Before working on unit place the master switch in the OFF position and disconnect all electrical power.

b. Remove (8) screws securing the unit cover to the base pan assembly. See Figure 3-26.

c. Carefully lift the exterior cover off of the unit base pan assembly.

d. Reverse above procedure for reassembly.

![Figure 3-26 Cover Assembly - Low Profile](image)

3.6.2 Upper Scroll Assembly Removal

To remove the upper scroll assembly, do the following:

a. Remove exterior cover assembly. Refer to paragraph 3.6.1.

b. Release the (2) front, (2) rear, (1) left side and (1) right side locking tabs (See Figure 3-27) by pulling back on the tabs (See Figure 3-28).

c. Remove the screw (1) from the control box cover (See Figure 3-27).

d. With all (6) locking tabs released and control box screw removed, lift the upper scroll assembly off of the lower scroll assembly.

e. Reverse above procedure for reassembly. Ensure all (6) locking tabs snap shut & lock.

![Figure 3-27 Upper Scroll Assembly Locking Tabs (b.) & Screw Locations (c.)](image)

![Figure 3-28 Upper Scroll Assembly Keeper Tab Release](image)
To remove condenser fan assembly, do the following:

- Perform steps outlined in Section 3.6.2.
- Depress and remove Retaining Ring (See Figure 3-30).
- Using both hands, carefully pull up on fan assembly until it is free of the motor shaft.
- When replacing the fan assembly make sure the fan assembly is against the stop on the shaft (See Figure 3-31).
- Push back on tab to allow fan assembly to rest against stop (See Figure 3-32). Fan assembly will now be flush with the end of the motor shaft.
- Reverse above procedure for reassembly.
### 3.6.4 Condenser Motor Removal
To remove condenser fan motor, do the following:
- a. Perform steps outlined in Section 3.6.2.
- b. Remove (3) 13MM bolts (See Figure 3-31).
- c. Remove (3) Grommets. Inspect, replace or reuse.
- d. Cut Tie-Wraps & discard (2 locations). When reassembling, tie-wrap at same 2 locations.
- e. Remove ground wire from compressor bracket (See Figure 3-33).
- f. Un-plug (yellow/brown/white) from control box assembly.
- g. Reverse above procedure for reassembly.

<Figure 3-33 Condenser Motor Ground>

### 3.6.5 Evaporator Motor/Blower Assembly Removal
To remove the evaporator motor, do the following:
- a. Perform steps outlined in Section 3.6.2.
- b. Pull back on and release the (4) locking tabs. There are 2 on each side of the control box assembly. (See Figure 3-34).
- c. Lift control box assembly from lower scroll assembly, exposing evaporator motor.
- d. Un-plug (black/blue/white/brown) evaporator motor from control box assembly.
- e. Remove ground wire (green/yellow) from motor housing.
- f. Lift motor/blower assembly from lower scroll assembly cradle.
- g. Carefully remove the blower wheel from the evaporator motor shaft by pushing out from the motor side.
NOTE
When reassembling the blower wheel on to the motor shaft ensure that the blower wheel is flush with the end of the motor shaft (See Figure 3-36).

 NOTE
When placing the evaporator motor/blower assembly back into the lower scroll assembly cradle, make sure that the assembly is seated securely in the cradle. (See Figure 3-35).

h. Reverse above procedure for reassembly.

3.6.6 Compressor Replacement
Perform the procedures outlined in Section 3.5.2
There are 4 bolts with the Low Profile Compressor.
The system charge for the Low Profile unit is 16.9 OZ.

3.6.7 Capacitor Removal
To remove the capacitor, do the following:
a. Perform steps a., b. & c. as outlined in Section 3.6.5.
b. Perform steps outlined in Sections 3.5.8 & 3.5.9.
c. The Low Profile Capacitor is removed from the control box assembly by pushing on the capacitor from under the control box assembly (See Figure 3-35).

3.6.8 Remote Control (Fahrenheit to Celsius)
All Remote Control Assemblies in the United States are pre-set to display in Fahrenheit degrees (see Figure 3-38). To change from a Fahrenheit display to a Celsius display do the following:

CAUTION
The change from Fahrenheit to Celsius will be permanent. It cannot be changed back to Fahrenheit.
a. Remove the batteries from the remote control.
b. Carefully remove the remote cover by inserting a nar-
row flat object between the cover and remote body 
and prying apart.
c. Remove the brass screw holding the PCB in place.
d. Carefully remove the PCB board from the remote 
body, making sure the battery springs release from 
their holders.
e. Locate FR9 on the PCB board (see Figure 3-39).
f. Carefully cut the FR9 jumper wire.
g. Reverse above procedure for reassembly.

**CAUTION**

When re-assembling, ensure the battery 
Springs are correctly placed in the battery spring holders.
3.7 THERMOSTAT INSTALLATION AND START-UP INSTRUCTIONS (WALL MOUNTED)

3.7.1 Introduction
The thermostat is a wall mounted, low-voltage thermostat which maintains room temperature by controlling the operation of a heating and air conditioning system. Batteries are not required; temperature and mode settings are preserved with the power off.

**CAUTION**
Improper wiring or installation may damage thermostat. Wiring must conform to local and national electrical codes.

**WARNING**
Before installing thermostat, turn off all power to unit. There may be more than one power disconnect. Electrical shock can cause personal injury or death.

3.7.2 Installation
**NOTE**
Read all instructions before starting the installation.

**NOTE**
The thermostat requires no batteries. The thermostat is not a power stealing device and MUST have both R and C connected.

3.7.3 Thermostat Location
The thermostat should be mounted:
- Approximately 5 foot (1.5m) from the floor.
- Close to or in a frequently used room, preferably on an inside partitioning wall.
- On a section of wall without pipes or duct work.

The thermostat should NOT be mounted:
- Close to a window, or an outside wall, or next to a door leading to the outside.
- Exposed to direct light and heat from a lamp, sun, fireplace, or other temperature-radiating object which may cause a false reading.
- Close to or in direct airflow from supply registers and return-air grilles.
- In areas with poor air circulation, such as behind a door or in an alcove.

3.7.4 Install Thermostat - 12VDC
a. Turn off all power to unit.
b. If an existing thermostat is being replaced:
   1. Remove existing thermostat from wall.
   2. Disconnect wires from existing thermostat, one at a time. Be careful not to allow wires to fall back into the wall.
   3. As each wire is disconnected, record wire color and terminal marking.
   4. Discard or recycle old thermostat.

**NOTE**
Mercury is a hazardous waste and must be disposed of properly.

c. Separate the front and back pieces of plastic.
d. Route thermostat wires through hole in back piece of plastic. Level plastic against wall (for aesthetic value only – thermostat need not be leveled for proper operation) and mark wall through 2 mounting holes.
e. Drill two 3/16 inch mounting holes in wall where marked.

**NOTE**
Mounting holes on thermostat are designed to fit on a horizontal J-Box.

f. Secure back plastic to wall with 2 anchors and screws provided, making sure all wires extend through hole in plastic.
g. Connect wires to proper terminal of the connector block in the front piece of plastic.
h. Push any excess wire back into wall. Excess wire inside the thermostat plastic case can interfere with proper air flow across the temperature sensor. Seal hole in wall to prevent air leaks. Leaks can effect operation.
i. Snap front and back pieces of plastic together.
j. Turn on power to the unit.

3.8 LCD DISPLAY
3.8.1 Cool Only Thermostat (Part No. 1110-421)
On power up, the LCD readout will display C (Cool Only).

3.8.2 Heat/Cool Thermostat (Part No. 1110-420)
On power up, the LCD readout will display HC (Heat/Cool).

3.9 SET THERMOSTAT CONFIGURATION
While in configuration mode, three option choices can be made.

A - Anticipator Value Adjustment
d - Display Temperature Fahrenheit/Celsius Selection
OF - Offset Adjustment For Room Temperature

3.9.1 Enter Configuration Mode
Enter and hold the FAN button for approximately 10 seconds until room temperature disappears and the display reads A. You are now in the configuration mode.
NOTE
If the FAN button is pressed again or if no button is pressed for two minutes, the thermostat will exit the configuration mode and return to normal operation. To re-enter the configuration mode, the FAN button must be pressed and held for 10 seconds again.

While in the configuration mode, the following options are available:

**A. ANTICIPATOR - Value Adjustment**
This adjustment controls the sensitivity and cycle rate of the thermostat. Higher numbers decrease the sensitivity and slow the cycle rate. Lower numbers increase the sensitivity and increase the cycle rate. However, a limiting feature will not allow more than 4 equipment cycles per hour, regardless of setting. Values can range from 1 to 3. Factory default setting is 2. This default selection will provide optimum performance in nearly all installations. Try it first. Do not change settings unless there is evidence of need to do so. Unlike conventional anticipators, this setting is not determined by current draw. There is no need to measure, know, or compensate for current.

To Adjust:
- a. Enter configuration mode (if not already there).
- b. Use UP & DOWN buttons to display A.
- c. Press MODE button once to display current value.
- d. Use UP & DOWN buttons to move between values.
- e. Press MODE button to return to A. UP & DOWN buttons now move between option choices A, d, or F.

**d. Fahrenheit/Celsius Selection**
This selection operates the thermostat in either Fahrenheit or Celsius.

To Select:
- a. Enter configuration mode (if not already there).
- b. Use UP & DOWN buttons to display d.
- c. Press MODE button once to display current selection of F or C.
- d. Use UP & DOWN buttons to change between F & C.
- e. Press MODE button to return to d. UP & DOWN buttons now move between option choices; or press FAN button to exit configuration mode.

**oF. Room Temperature Offset Adjust Selection**
The selected number is the number of degrees, plus or minus, which will be added to the actual temperature. The numbers can range between -5 and +5. Factory default is 0. This adjusted value will be used as actual temperature for both display and control action. The effect is that a positive number selection will make the room temperature lower, and vice versa. The thermostat is calibrated within an accuracy of plus or minus 2 degrees when shipped from the factory; this adjustment will provide the best accuracy when set to 0.

To Select:
- a. Enter configuration mode (if not already there).
- b. Use UP & DOWN buttons to display oF.
- c. Press MODE button once to display offset value.
- d. Use UP & DOWN buttons to select a value between -5 and 5.
- e. Press MODE button to return to oF. UP & DOWN buttons now move between option choices; or press FAN button to exit configuration mode.

### 3.10 CHECK THERMOSTAT OPERATION

#### 3.10.1 Fan Operation (Cool Only)
1. Press FAN button, starting fan operation. FAN annunciator turns on; Lo is displayed in the room temperature area for 5 seconds indicating Fan Low Speed.
2. Press FAN button, FAN annunciator remains on; Hi is displayed in room temperature area for 5 seconds indicating Fan High Speed.
3. Press FAN button, stopping fan operation. FAN annunciator turns off.

#### 3.10.2 Fan Operation (Heat/Cool)
1. Press FAN button, starting low fan (Lo) operation. FAN annunciator turns on.
2. Press FAN button, starting high fan (Hi) operation. FAN annunciator remains on.
3. Press FAN button, stopping fan operation. FAN annunciator turns off.

#### 3.10.3 Cooling Operation (Cool Only)
1. Press and release MODE button until COOL is displayed.
2. Press DOWN button until LCD readout reads 10 degrees below room temperature. Cooling and High Fan system should begin to operate within 5 minutes.

#### 3.10.4 Cooling Operation (Heat/Cool)
1. Press and release MODE button until COOL is displayed.
2. Press DOWN button until LCD readout reads 10 degrees below room temperature. Cooling and High Fan system should begin to operate within 5 minutes.

#### 3.10.5 Heating Operation (Heat/Cool)
1. Press and release MODE button until HEAT is displayed.
2. Press UP button until LCD readout reads 10 degrees above room temperature. Heating system should begin to operate within 1 minute.

### 3.11 CHECK THERMOSTAT OPERATION

#### 3.11.1 Temperature Display
The thermostat will display room temperature until the UP or DOWN button is pressed. The word SET appears when these buttons are pressed and the current set point is displayed. If no buttons are pressed for 5 seconds, the display will change back to show room temperature.
3.11.2 Timeguard Timer

A 3-minute timeguard is built into the thermostat immediately upon power up, and any time the compressor (output “Y”) turns off. The compressor will not turn on until the timeguard has expired. Pressing UP and FAN buttons simultaneously will override the timeguard for 1 cycle.

3.11.3 Cycle Timer

In normal cooling (and heating) operation the thermostat will not allow more than 4 equipment cycles per hour (or 1 cycle every 15 minutes). Both the “Y” (cooling) and “W” (heating) outputs have a 15-minute timer that starts counting down when the output is turned on, (e.g., if “Y” output is turned on for 9 minutes and then satisfies, it cannot turn back on for another 6 minutes regardless of demand). However, pressing UP and FAN buttons simultaneously or changing the set point will override the timer for 1 cycle.

3.11.4 Minimum On Timer

Once the equipment has turned on, it will remain on for a minimum of 2 minutes regardless of demand. However, the equipment can turn off in less than 2 minutes if a change in set point, or a change in mode occurs.

3.11.5 Error Messages

E4 will be displayed if the thermostat has an internal memory failure. If E4 appears, replace the thermostat.

-- (two dashes) will be displayed if the thermostat cannot properly read the room temperature. If -- appears, replace the thermostat.

Over the years of running a mobile RV repair service, having a dedicated place to access service manuals for all the different appliances and components found on RVs was something that I always had a desire to create.

I hope this resource makes your RV repairs easier, as it has mine, but please be careful and follow proper safety practices when attempting to repair your own RV.

If in doubt, please consult with a professional RV technician!

All service manuals provided on www.myrvworks.com are believed to be released for distribution and/or in the public domain.
