

Automatic Energy Select Switch

Intellitec's **Automatic Energy Select Switch (AESS)** is designed to be used in RVs to share the power available from a single circuit breaker between two large loads. The **AESS** applies power to both appliances until the primary load is turned on. It then removes power from the secondary load to prevent the circuit breaker from being overloaded. This function is particularly useful for sharing power between the microwave oven and another "shed-dable" or postpone-able appliance, such as the washer/dryer, or water heater. Typically, this function has performed with selector switches, forcing the owner to manually switch between the two appliances.

The selecting function is particularly useful when the microwave oven is the principal load. Power is always available to it, assuring that the customer can use the microwave whenever required and it's internal clock remains operating. While the microwave is in use, the function of the secondary load is postponed until the microwave is finished.

Features:

- Allows two 20 Amp loads to operate from a single 20 Amp breaker
- Automatically switches between the two loads as the demand requires
- Meets NEC section 551-42(c) for adding breakers over the maximum limit of five and allowing for more than two, thermostatically controlled appliances.
- Minimizes circuit breaker tripping.
- Eliminates manual appliance select switches.

AESS OPERATION

The underlying principle of the AESS is that certain appliances used in an RV, such as the microwave oven, hair dryer, or toaster need to always be available, when the owner wants to use them. These are "on demand" appliances. The use of others, such as the washer/dryer, water heater, or air conditioner can be delayed to a slightly later time with little inconvenience to the owner. These are postpone-able loads. Postponing the use of these appliances leaves enough power to operate the "on demand" appliances.

Power is supplied to the AESS from a single circuit breaker. An "on demand" load is connected as the primary load and a "shed-able" load is connected as the secondary load. When power is applied to the RV, it is supplied to both loads. When the primary load is turned off and at least 45 seconds has passed, power to the secondary load will be reapplied.

Automatic Energy Select Switch

How Does It Work?

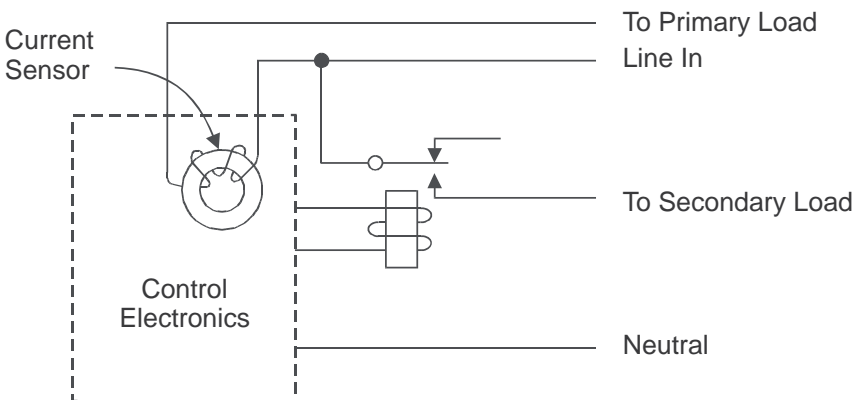

The **Automatic Energy Select Switch** controls power to two appliance loads. One appliance on the primary load is connected to the primary output and a shed-able appliance is connected to the secondary output. The output to the secondary load is carried through a relay.

When the shore cord is first plugged in, power flows through the **AESS** to the primary load and the relay is quickly closed, supplying power to the secondary load. When the primary load is turned off for more than 45 seconds, the power is re-applied to it.

Specifications:

Part Number:	00-00714-000
Ambient Temperature Range:	-40C to +40C
Operating Environment:	Out of direct weather
Delay before reapplying power:	45 seconds
Controlled Load:	One, OEM selectable
Relay Rating:	(1) AC - 1 HP, 20A, 120 VAC 60 HZ

You can find more RV service manuals here:

www.myrvworks.com/manuals

Over the years of running a mobile RV repair service, having a dedicated place to access service manuals for all the different appliances and components found on RVs was something that I always had a desire to create.

I hope this resource makes your RV repairs easier, as it has mine, but please be careful and follow proper safety practices when attempting to repair your own RV.

If in doubt, please consult with a professional RV technician!
