A FEW WORDS ABOUT SAFETY

SERVICE INFORMATION
The service and repair information contained in this manual is intended for use by qualified, professional technicians. Attempting service or repairs without the proper training, tools, and equipment could cause injury to you and/or others. It could also damage the generator or create an unsafe condition.

This manual describes the proper methods and procedures for performing service, maintenance, and repairs. Some procedures require the use of special tools. Any person who intends to use a replacement part, service procedure, or a tool that is not recommended by Honda must determine the risks to their personal safety and the safe operation of the generator.

If you need to replace a part, use Honda Genuine parts with the correct part number, or an equivalent part. We strongly recommend that you do not use replacement parts of inferior quality.

For Your Customer’s Safety
Proper service and maintenance are essential to the customer’s safety and the reliability of the generator. Any error or oversight while servicing the generator can result in faulty operation, damage to the generator, or injury to others.

For Your Safety
Because this manual is intended for the professional service technician, we do not provide warnings about many basic shop safety practices (e.g., Hot parts – wear gloves). If you have not received shop safety training or do not feel confident about your knowledge of safe servicing practices, we recommend that you do not attempt to perform the procedures described in this manual.

Some of the most important general service safety precautions are given below. However, we cannot warn you of every conceivable hazard that can arise in performing service and repair procedures. Only you can decide whether or not you should perform a given task.

Important Safety Precautions
- Make sure you have a clear understanding of all basic shop safety practices and that you are wearing appropriate clothing and using safety equipment. When performing any service task, be especially careful of the following:
  - Read all of the instructions before you begin, and make sure you have the tools, the replacement or repair parts, and the skills required to perform the tasks safely and completely.
  - Protect your eyes by using proper safety glasses, goggles, or face shields any time you hammer, drill, grind, or work around pressurized air or liquids, springs, or other stored-energy components. If there is any doubt, put on eye protection.
  - Use other protective wear when necessary, for example, gloves or safety shoes. Handling hot or sharp parts can cause severe burns or cuts. Before you grab something that looks like it can hurt you, stop and put on gloves.

- Make sure the engine is off before you begin any servicing procedures, unless the instruction tells you to do otherwise.
  - This will help eliminate several potential hazards:
    - Carbon monoxide poisoning from engine exhaust. Be sure there is adequate ventilation whenever you run the engine.
    - Burns from hot parts. Let the engine and exhaust system cool before working in those areas.
    - Injury from moving parts. If the instruction tells you to run the engine, be sure your hands, fingers, and clothing are out of the way.

- Gasoline vapors and hydrogen gases from batteries are explosive. To reduce the possibility of a fire or explosion, be careful when working around gasoline or batteries.
  - Use only a nonflammable solvent, not gasoline, to clean parts.
  - Never drain or store gasoline in an open container.
  - Keep all cigarettes, sparks, and flames away from the battery and all fuel-related parts.
INTRODUCTION

This manual covers service and repair procedures for the Honda EU2000i generators. A supplement for the EU2000i Companion generator is located in the back of this manual.

All information contained in this manual is based on the latest product information available at the time of printing. We reserve the right to make changes at any time without notice.

No part of this publication may be reproduced, stored in a retrieval system, or transmitted, in any form by any means, electronic, mechanical, photocopying, recording, or otherwise, without prior written permission of the publisher. This includes text, figures, and tables.

As you read this manual, you will find information that is preceded by a [NOTICE] symbol. The purpose of this message is to help prevent damage to the generator, other property, or the environment.

SAFETY MESSAGES

Your safety and the safety of others are very important. To help you make informed decisions, we have provided safety messages and other safety information throughout this manual. Of course, it is not practical or possible to warn you about all the hazards associated with servicing these generators. You must use your own good judgement.

You will find important safety information in a variety of forms, including:

• Safety Labels – on the generator.

• Safety Messages – preceded by a safety alert symbol ⚠️ and one of three signal words: DANGER, WARNING, or CAUTION.

These signal words mean:

⚠️ DANGER
You WILL be KILLED or SERIOUSLY HURT if you don’t follow instructions.

⚠️ WARNING
You CAN be KILLED or SERIOUSLY HURT if you don’t follow instructions.

⚠️ CAUTION
You CAN be HURT if you don’t follow instructions.

• Instructions – how to service these generators correctly and safely.

3. PERFORMANCE CURVES

The curves show performance of the generator under average conditions. Performance may vary to some degree depending on ambient temperature and humidity. The output voltage will be higher than usual when the generator is still cold, immediately after the engine starts.

1. SYMBOLS USED IN THIS MANUAL
As you read this manual, you may find the following symbols with the instructions.

- **S.T.OOL.** A special tool is required to perform the procedure.
- **GREASE** Apply grease.
- **OIL** Apply oil.

○ x ○ (○): Indicates the diameter, length, and quantity of metric flange bolts used.

P. ○ — ○ Indicates the reference page.

2. SERIAL NUMBER LOCATIONS
The frame serial number is shown at the underside of the right side cover, and the engine serial number is stamped on the cylinder block. Refer to these numbers when ordering or making technical inquiries.
3. ELECTRIC PRECAUTIONS

1. Hold the connector body to disconnect the connector. Do not disconnect by pulling the wire harness. To disconnect the locking connector, be sure to unlock first, then disconnect.

2. Check the connector terminals are not bend, damaged, or missing before connecting the connector.

3. To connect, insert the connector as far as it goes. If the connector is a locking type, be sure that it is locked securely.

4. Check the connector cover for breakage and check that the connector female terminal is not open excessively. Then, connect the connector securely. Check the connector terminal for rust. Remove the rust using emery paper or equivalent material before connecting the connector.

5. Set the harness clips in the specified places of the frame securely, and secure the wire harnesses.

6. Clamp the cables securely.

7. Clamp the wire harnesses securely so that they do not interfere with the rotating parts, moving parts and the hot parts.

8. Route and connect the wire harnesses properly. Be sure that the harnesses are not slack, twisted or pulled taut.

9. Route the wire harnesses properly so that they do not contact with the sharp edges and corners, and the end of the bolts and screws on the body.

10. If a wire harness contacts the end of the bolts/screws or sharp edges and corners, protect the contact part of the harness with a tube or by winding with electrician’s protective tape. If the wire harness has a grommet, set the grommet securely.

11. Take care not to pinch the wire harnesses during installation of a part. If a wire harness has damaged insulation, repair by winding with electrical insulating tape.

12. Read the tester manufacturer's operation instructions carefully before using a tester. Follow the instructions in the Service Manual. Be sure that battery in the tester is fully charged, and check the meter before inspection using the tester.

7. TROUBLESHOOTING

a. GENERAL SYMPTOMS AND POSSIBLE CAUSES

- Engine does not start or hard starting.
  - CARBURETOR FLOAT CHAMBER contains stale gasoline, or no fuel reaches the carburetor. 
    - Drain old fuel and check and clean (P. 5-4).
  - FUEL TANK TUBE clogged.
    - Inspect (P. 3-7).
  - DIAPHRAGM TUBE disconnected.
    - Connect (P. 2-22).
  - FUEL FILTER clogged.
    - Clean (P. 3-7).
  - FUEL PUMP clogged.
    - Inspect (P. 3-7) and replace (P. 7-2).
  - CARBURETOR faulty.
    - Readjust (P. 5-5) and/or disassemble and clean (P. 5-4).
  - SPARK PLUG CAP disconnected.
    - Install securely.
  - IGNITION PULSE GENERATOR air gap incorrect.
    - Replace (P. 9-1).
  - IGNITION COIL faulty.
    - Inspect (P. 8-4) and replace (P. 8-1).
  - SPARK PLUG faulty.
    - Inspect and replace (P. 3-4).
  - ENGINE SWITCH faulty.
    - Inspect (P. 7-5) and replace (P. 7-4).
  - OIL LEVEL SWITCH faulty.
    - Inspect (P. 10-17) and replace (P. 10-14).
  - IGNITION CONTROL MODULE faulty.
    - Inspect (P. 6-4) and replace (P. 6-2).
  - IGNITION PULSE GENERATOR faulty.
    - Inspect (P. 9-3) and replace (P. 9-1).
  - EXCITER COIL faulty.
    - Inspect (P. 9-3).
  - VALVE CLEARANCE incorrect.
    - Adjust (P. 3-5).
  - THROTTLE VALVE set in fully closed position when reassembling.
    - Set in fully open position.
Abnormal engine speed (Engine speed does not stabilize, too high or too low).

- **CARBURETOR** faulty.
  - Adjust (P. 5-5) and/or disassemble and clean (P. 5-4)

- **THROTTLE CONTROL MOTOR** faulty.
  - Inspect (P. 5-6).

- **GENERATOR** faulty.
  - Troubleshoot (P. 2-17).

- **INVERTER UNIT** faulty.
  - Troubleshoot (P. 2-17).

- **IGNITION CONTROL MODULE** faulty.
  - Inspect (P. 6-4).

- **VALVE CLEARANCE** incorrect.
  - Adjust (P. 3-5).
b. ENGINE

• Hard Starting

If the engine does not start or is hard starting after reassembly, check to see whether the throttle valve is at the full open position.

1. Check the fuel level in the tank.
   - Sufficient fuel
   - No fuel → Add fuel and restart the engine.

2. Losen the drain screw and check whether fuel reaches the carburetor.
   - Fuel reached the carburetor
   - Fuel not reaching carburetor → Check for blockage of the fuel tube, fuel filter or fuel pump.

3. Remove the spark plug and check for wet or fouled electrode.
   - Dry → Check for blockage in the carburetor port and nozzle.
   - Wet
     - Clean the electrode and restart, taking care that the choke is not closed too much.
     - If flooding is severe, check the carburetor float valve.

4. Perform spark test (P. 2-12).
   - Good spark
   - No spark or weak spark → Perform the ignition system troubleshooting (P. 2-12).

5. Install a compression gauge in the spark plug hole and check the cylinder compression by pulling the recoil starter rope several times (see below).
   - Normal compression
   - High cylinder compression → Check for carbon deposits in the combustion chamber.
   - Low cylinder compression

6. Install the spark plug securely. Restart the engine according to the starting procedure.

• CYLINDER COMPRESSION CHECK

1) Remove the spark plug cap and the spark plug, and install a compression gauge in the spark plug hole.

2) Pull the recoil starter rope forcefully several times, and measure the cylinder compression.

Cylinder compression: 0.49 MPa (5.0 kgf/cm², 71 psi) at 700 min⁻¹ (rpm)
• **Engine Stares but Then Stalls**

1. Check the fuel level in the tank.
   - No fuel: Add fuel.
   - Sufficient fuel

2. Check for the clogged fuel filter.
   - Clogged: Clean the fuel filter (P. 3-7).
   - Not clogged

3. Check for blockage of the fuel pump and diaphragm tube.
   - Clogged: Replace the fuel pump.
     Clean or replace the diaphragm tube.
   - Not clogged

4. Check for blockage of the fuel hose.
   - Clogged: Clean or replace the fuel tube.
   - Not clogged

5. Check for loose nuts holding the air intake joint and carburetor, or air leakage through a damaged carburetor gasket, insulator, or insulator gasket.
   - Abnormal: Tighten the nuts securely.
     Install a new carburetor insulator or gasket.
   - Normal

6. Measure the cylinder compression (P. 2-9).
   - Abnormal: Low compression
     Check whether the valve clearance is correct (P. 3-5).
     Check for worn piston, piston ring, cylinder or valves.
     High compression: Check for carbon deposits in the combustion chamber.
   - Normal

7. Check the ignition pulse generator air gap (P. 9-4).
   - Incorrect: Replace the ignition pulse generator (P. 9-1).
   - Correct

8. Perform the throttle control system troubleshooting (P. 2-16).
- **Engine Speed Does Not Increase or Stabilize.**

1. Check the air filter.  
   - Clogged  
     - Clean the air filter (P. 3-3).
   - Not clogged

2. Check the valve clearance.  
   - Abnormal  
     - Adjust the valve clearance (P. 3-5).
   - Normal

3. Remove the spark plug and check the electrodes for carbon and spark plug gap.  
   - Abnormal  
     - Clean the spark plug and adjust the spark plug gap (P. 3-4)
   - Normal

4. Check for blockage of the main jet.  
   - Clogged  
     - Disassemble and clean (P. 5-4).
   - Not clogged

5. Check for loose nuts holding the air intake joint and carburetor, or air leakage through a damaged gasket, insulator, or insulator gasket.  
   - Abnormal  
     - Tighten the nuts securely.
     - Install a new carburetor insulator or gasket.
   - Normal

6. Perform the cylinder compression check (P. 2-9).  
   - Low compression  
     - Clean the valve and valve seat for damage and wear.
     - Check the piston, piston ring, cylinder or valves for wear and damage.
   - Normal compression
   - High compression  
     - Check for carbon deposits in the combustion chamber.
   - Perform the throttle control system troubleshooting (P. 2-15).
c. IGNITION SYSTEM

Make a copy of the EU2000i Ignition System Troubleshooting Worksheet (P. 2-13b) and document your test results for future reference or in case you need to call Techline.

1. Turn the engine stop switch to the ON position and pull the starter grip. Verify the Oil Alert® indicator is not flashing.

   If flashing, add oil to bring the level to the upper limit.

2. Remove the maintenance cover.

3. Clamp the carburetor inlet fuel line and drain the carburetor float bowl.

4. Remove the air cleaner case (P. 5-1).

5. Remove the spark plug and pull the starter grip several times to remove any unburned fuel from the combustion chamber.

6. Insert the spark plug into the spark plug boot.

7. Set the ignition switch to the ON position.

8. Ground the negative (-) electrode (threaded part) of the spark plug against the shrouds.

9. Pull the starter grip and check for spark at the spark plug.
If there is no spark at the spark plug, replace the spark plug with a new one and recheck for spark.

10. Disconnect the engine stop switch 2-pin connector and recheck for spark.

There should be spark with the switch disconnected.
• If there is spark, replace the engine stop switch and retest for spark.
• If there is no spark, document your results and continue.

11. Disconnect the 6-pin connector.

12. Test the oil level switch. Make sure the oil level in the engine is correct and the generator is on a level surface. On the engine side of the 6-pin connector, check for continuity between the yellow wire and green wire.

There should be no continuity with the proper oil level.

Document your results and continue.

13. Measure the resistance of the ignition pulse generator (IPG).

On the engine side of the 6-pin connector, test between the blue wire and green wire.

**Specification**: $300 \sim 360 \, \Omega$

Document your results and continue.

14. Measure the DC millivolt output of the ignition pulse generator (IPG).

On the engine side of the 6-pin connector, test between the blue wire and green wire and pull the starter grip.

**Specification**: $3 \sim 4 \, \text{mV DC}$

Document your results and continue.
15. Measure the resistance of the exciter winding.

On the engine side of the 6-pin connector, test between the black/blue wire and green wire.

**Specification: 0.2 ~ 0.3 Ω**

Document your results and continue.

If the exciter winding measures a little over the specification, it may not need to be replaced. Additional resistance of 0.4 ~ 0.5 ohms will not cause a no-spark condition.

16. Measure the AC voltage output of the exciter winding.

On the engine side of the 6-pin connector, test between the black/blue wire and green wire and pull the starter grip.

**Specification: 4 ~ 5 VAC**

Document your results and continue.

17. Measure the ignition coil resistance.

Disconnect the black bullet connector.

**Primary winding:** on the engine side of the connectors, measure between the black single bullet connector and the green wire of the 6-pin connector.

Document your results and continue.

**Specification: 0.7 ~ 1.1 Ω**

If the ignition coil measures a little over the specification, it may not need to be replaced. Additional resistance of 0.4 ~ 0.5 ohms will not cause a no-spark condition.

**Secondary winding:** on the engine side of the connector, measure between the green wire of the 6-pin connector and the spark plug cap.

**Specification: 12 K ~ 21 KΩ**

Document your results and continue.
18. Remove the control panel 5 x 16 mm self-tapping screws to access the wires behind it. Inspect the ignition control module (ICM) pins and ICM wire harness connector for loose, dirty, or corroded connections.

Green colored deposits on the pins or terminals are an indication of corrosion.

- If corrosion is present on the ICM pins or the ICM wire harness, replace the ICM and wire harness and recheck for spark.
- If the ICM and ICM wire harness are OK, go to the conclusion.

**CONCLUSION**

- If all components passed the tests, replace the ignition control module and recheck for spark.
- If the engine stop switch, oil level switch, or ignition coil do not pass the tests, replace the failed component and recheck for spark.
- If the exciter fails EITHER test, replace the stator.
  
  Replacing the stator under warranty requires PRIOR authorization.
- If the ignition pulse generator (IPG) fails BOTH tests, replace the IPG and recheck for spark.

If you are unsure of the necessary repair, contact Techline with your completed test record results for guidance.

   Replace the oil level switch (P. 10-14).

   Repair or replace the wire harnesses.

   Perform the spark test again. Replace the ignition control module, if there is spark.
d. THROTTLE CONTROL SYSTEM

• Engine Speed is Too High, Unstable.

1. Check the AC output (P. 2-17).
   Abnormal → Perform generator troubleshooting following
   the instruction for “No or low AC output” (P. 2-17).
   Normal

2. Perform the engine troubleshooting following
   the instruction of “Engine speed does not stabilize” (P. 2-11).

3. Check the throttle control motor (P. 5-6).
   Abnormal → Replace the throttle control motor (P. 5-3).
   Normal

4. Check each wire harness for open circuit, short circuit and connection.
   Abnormal → Repair or replace the wire harness.
   Normal

   Replace the inverter unit.

• Engine Speed Too Low.

1. Check the AC output (P. 2-17).
   Abnormal → Perform generator troubleshooting following
   the instruction of “No or low AC output” (P. 2-17).
   Normal

2. Check the throttle control motor (P. 5-6).
   Abnormal → Replace the throttle control motor (P. 5-3).
   Normal

3. Check each wire harness for open circuit, short circuit and connection.
   Abnormal → Repair or replace the wire harness.

Replace the inverter unit.

- Perform generator troubleshooting following the instruction for "No or low AC output" (P. 2-17).
- Replace the throttle control motor (P. 5-3).
- Replace the ECO throttle switch (P. 6-2).
- Repair or replace the wire harness.
e. GENERATOR

- No or low AC output

**WARNING**

High voltage and electrical current present. Touching the non-insulated portions of the meter leads or generator wiring can cause shock or electrocution.
Wear insulated gloves and avoid handling non-insulated wiring.

Use a load bank (available through the Honda Tool and Equipment Program or the Parts Division) to verify the customer's initial complaint and the generator's performance after the repairs (see page 5-2 of the Generator Troubleshooting manual).

COMPLAINT: Abnormal output (none, low, or high) at the AC receptacle. **Normal AC output:** 120 VAC ± 18.

1. With the engine running, check the overload indicator light is OFF and the AC circuit protector is ON.
2. Check the AC output indicator light. If ON, inspect the AC receptacle or wiring to the receptacle. If OFF, proceed below.
3. Remove the maintenance cover.

4. Disconnect the 6-pin connector. With the 6-pin connector disconnected, the Eco-Throttle will not operate.

5. Manually set the rpm by moving the throttle lever with your finger. **Standard no-load speed:** 4,200 – 4,600 rpm.

   - All windings test equally LOW

   - **Stator winding(s) faulty.** Replace the stator. Call Techline.
   - **Rotor magnet(s) weak.** Replace the rotor. Call Techline.

   - Reassemble the generator. Proceed to step 8.

   - **Inspect the receptacle. Replace as necessary.**

   - **Replace the inverter. Call Techline.**
   - Reassemble the generator. Proceed to step 8.

   - OK
8. Check AC output voltage at the 120V receptacle.

   OK
   NG  Call Techline.

The generator must match the load.

10. Problem is in the load or customer usage. Verify generator usage.

   Check the following:
   • Carbon deposits in combustion chamber or spark arrester.
   • Eco-Throttle system not functioning properly.
   • Fuel system
   • Engine compression
   • Repair as necessary and repeat load bank test (step 9).

---

**GENERATOR TEST POINTS**

Test at the 6-pin connector with it unplugged from the inverter.
• No or low DC output

Engine running

1. Is the engine speed normal?
   Engine speed: 4,300 ± 100 min⁻¹ (rpm)
   (ECO throttle OFF)
   Normal
   Abnormal
   Perform throttle control system troubleshooting (P. 2-15 and 16).

Engine stopped

2. Check the DC receptacle (P. 6-3).
   Normal
   Abnormal
   DC receptacle is faulty.
   • Replace the DC receptacle.

Engine stopped

3. Check the rectifier (P. 8-4).
   Normal
   Abnormal
   Rectifier is faulty.
   • Replace the rectifier.

Engine stopped

4. Measure the resistance between the brown DC coil terminals of the rectifier 4P connector.
   Resistance: 0.1 ~ 0.2 Ω
   Normal
   Abnormal
   DC coil is faulty.
   • Check the wire harness (input line). If it is normal, replace the stator.

Engine running

5. Measure the voltage between the brown DC winding terminals of the rectifier 4P connector.
   Voltage: 19 ~ 23 Vac
   Low
   Rotor magnet weak
   • Replace the rotor.
   Normal
   Wire harness (output line) is faulty.
   • Repair or replace the wire harness.
8. CARBLE & HARNESS ROUTING

- WIRE HARNESSSES

**OIL LEVEL SWITCH GROUND TERMINAL**

**INSTALLATION:**
Install noting the installation direction shown.

**PURSE LOCK CLIP**

**INSTALLATION:**
Clamp the generator harness and oil level switch yellow wire at terminal part.

**OIL LEVEL SWITCH WIRE**

**INVERTER UNIT**

**CONTROL WIRE HARNESS**

**INSTALLATION:**
Set the wire harness in the guide on the underside of the inverter unit securely.

**IGNITION COIL PRIMARY WIRE**

**INSTALLATION:**
Route the wire under the ignition coil and the rectifier and set in the grooves as shown.

**IGNITION COIL**

**GENERATOR HARNESS GROUND WIRE**

**INSTALLATION:**
Tighten the terminal pushing against the boss.
• CONTROL PANEL

INSTALLATION:
Install noting the installation direction shown.

- **DRAIN TUBE**
  - INSTALLATION: Set in the groove in the cover securely.
  - 5 - 10 mm (0.2 - 0.3 in)

- **DIAPHRAGM TUBE**
  - INSTALLATION: Insert the hose deep to the base of the joint securely.

- **FUEL TUBE (PUMP-CARBURETOR)**
  - INSTALLATION: Connect in the position shown.

- **FUEL HOSE (TANK-VALVE)**
  - INSTALLATION:
    - Set at the hook of the front from securely.
    - Take care not to interfere with the front frame.

- **FUEL PUMP**

- **L. FRONT FRAME**

- **FUEL VALVE**
  - Install the clip not to project over the fuel valve surface.

- **FUEL TUBE (VALVE-PUMP)**
  - INSTALLATION: Route the tube along the rib on the front frame.

- (1): For commercial use, log hours of operation to determine proper maintenance intervals.
- (2): Service more frequently when used in dusty areas.
2. OIL ALERT

- For convenience, perform this test in conjunction with the engine oil change.

1) Drain the engine oil and perform the spark test (P. 2-12).

   The oil alert light should go ON, and there should be no sparks at the spark plug electrodes.

2) Add engine oil to the specified level, and perform the spark test (P. 2-12).

   The oil alert light should stay OFF, and the sparks jump across the spark plug electrodes.

3) If there is any abnormality, perform ignition system troubleshooting (P. 2-12 and 13).

3. ENGINE OIL

Oil Level Check

Check the engine oil level with the engine stopped and the engine on a level surface.

1) Loosen the screw and remove the maintenance cover.

2) Remove the oil filler cap/dipstick, and check the oil level. It should be at the lower edge of the oil filler port.

3) If the oil level is low, add to the lower edge of the oil filler port.

   Change the oil if it is dirty or contaminated with foreign material.

<table>

</tbody>
</table>

Oil is a major factor affecting performance and service life. Use 4-stroke automotive detergent oil. SAE 10W-30 is recommended for general use. Other viscosities shown in the chart may be used when the average temperature in your area is within the recommended range.

4) Install the oil filler cap/dipstick securely.
• Oil Change:

Drain the used oil while the engine is warm. Warm oil drains quickly and completely.

1) Remove the maintenance cover. Remove the oil filler cap and drain the engine oil into a suitable container.

Please dispose of the used motor oil in a manner that is compatible with the environment. We suggest that you take used oil in a sealed container to your local recycling center or service station for reclamation. Do not throw it in the trash, pour it on the ground, or down a drain.

⚠️ CAUTION

Used engine oil contains substances that have been identified as carcinogenic.

If repeatedly left in contact with the skin for prolonged periods, it may cause skin cancer.

Wash your hands thoroughly with soap and water as soon as possible after contact with used engine oil.

2) Pour the specified amount of fresh engine oil through the oil filter port.

| Engine oil capacity | 0.40 l (0.42 US qt, 0.35 imp qt) |

3) After refilling, check the oil level again. If the level is low, add to the lower edge of the filler neck.

Do not overfill. If the engine is overfilled, the excess oil may get transferred to the air cleaner housing and the air filters.

4. AIR CLEANER

A dirty air cleaner will restrict air flow to the carburetor, reducing engine performance. If the engine is operated in dusty areas, clean the air cleaner more often than specified in the MAINTENANCE SCHEDULE.

NOTICE

Operating the engine without air filters or with damaged air filters, will allow dirt to enter the engine, causing rapid engine wear.

Inspection/Cleaning

1) Loosen the cover screw and remove the maintenance cover.

2) Loosen the cover screw and remove the air cleaner cover.

3) Remove the filters from the air cleaner case.
4) Clean the filters in warm soapy water, rinse and allow to dry thoroughly, or clean with a high flash point solvent and allow to dry.

Dip the filters in clean engine oil and squeeze out all the excess oil.
• Excess oil will restrict air flow through the foam filter and may cause the engine to smoke at startup.

5) Install the air cleaner filters in the air cleaner case.
• Clean the air cleaner rubber and the air cleaner case if necessary.
• Be sure that the air cleaner cover seal is set securely.

6) Install the air cleaner cover.
• Set the air cleaner cover on the air cleaner case and tighten the cover screw securely.
• Be sure that the air cleaner cover seal is set securely.
  Replace the cover seal if damaged.

**NOTICE**

A loose air cleaner cover can vibrate off while the generator is running. Operating the engine without air cleaner filters or with damaged air cleaner filters will allow dirt to enter the engine, causing rapid engine wear.

7) Install the maintenance cover securely.

---

5. SPARK PLUG

**Inspection/Cleaning:**

If the engine has been running, the engine will be very hot. Allow it to cool before proceeding.

1) Remove the plug cover.

2) Remove the spark plug cap, and remove the spark plug using a spark plug wrench.

  Visually inspect the spark plug. Discard the plug if the insulator is cracked or chipped.
4) Remove carbon or other deposits with a plug cleaner or stiff wire brush. Check the sealing washer for damage.

5) Measure the plug gap with a wire-type feeler gauge. If the measurement is outside the specification, adjust by bending the side electrode.

<table>
<thead>
<tr>
<th>Spark plug gap</th>
<th>0.6 – 0.7 mm</th>
</tr>
</thead>
</table>

| Recommended spark plug | NGK | CR5HSB |

5) Install the plug fingertight to seat the washer, then tighten with a plug wrench.
   • If reinstalling the used spark plug, tighten 1/8 – 1/4 turn after the spark plug seats.
   • If installing a new spark plug, tighten 1/2 turn after the spark plug seats.

**NOTICE**

A loose spark plug can become very hot and can damage the engine. Overtightening can damage the threads in the cylinder block.

6) Install the spark plug cap and plug cover.

6. VALVE CLEARANCE

• Valve clearance inspection and adjustment must be performed with the engine cold.

**Inspection:**

1) Remove the following parts.
   - Rear cover (P. 4-1).
   - Front cover, control panel (P. 6-1).
   - Right and left side covers (P. 7-1).
   - Fuel tank (P. 7-2).
   - Front frames under cover (P. 7-3).
   - Recoil starter, fan cover (P. 8-1).
   - Right and left shrouds (P. 8-5).

2) Loosen the four 6 x 28 mm flange bolts.

3) To remove the head cover, insert a screwdriver or equivalent tool into the cylinder recess as shown. Remove the head cover slowly.

   • Clean up any spilled engine oil with a shop towel when removing the head cover.

**NOTICE**

• Do not remove the head cover with force, because that can deform the head cover.
• Replace the head cover if it is deformed.
4) Remove the recoil starter (P. 8-1)

5) Set the piston top dead center of the compression stroke (both valves fully closed). Align the alignment point of the starter pulley with the “△” mark on the fan cover.

- If the exhaust valve opens when the alignment mark of the starter pulley with the “△” mark on the fan cover, turn the flywheel one turn and align the marks.

The top dead center of the compression stroke is in the position where the head cover mating surface is in line with the cam pulley alignment marks.

6) Insert a feeler gauge between the valve adjusting screw and the valve and measure the valve clearance.

<table>

**Adjustment:**

1) If adjustment is necessary, proceed as follows.

a. Hold the valve adjusting screw using the special tool, and loosen the lock nut.

**TOOL:**
Valve adjuster wrench, 3 mm 07908-KE90200

b. Turn the adjusting screw to obtain the specified intake and exhaust valve clearance.

c. Hold the valve adjusting screw using the special tool, and tighten the lock nut.

**TORQUE: 7.5 N·m (0.75 kgf·m, 5.4 lbf·ft)**

2) Recheck valve clearance after tightening the lock nut.

3) Clean the head cover installation surface of the cylinder block and head cover. Apply the liquid gasket (Three Bond 1207E, Hondabond #4, or equivalent) to the cylinder block installation surface as shown, and install the head cover.

Assemble the head cover within 3 minutes after application of the liquid gasket.

4) Tighten the 6 x 28 mm flange bolts.

5) Install the removed parts in the reverse order of removal.
7. FUEL TANK/FUEL FILTER

**WARNING**

Gasoline is highly flammable and explosive.

You can be burned or seriously injured when handling fuel.

- Keep heat, sparks, and flame away.
- Handle fuel only outdoors.
- Wipe up spills immediately.

**Cleaning:**

1) Drain the fuel from the tank and carburetor, then remove the following parts.
   - Rear cover (P. 4-1)
   - Front cover and control panel (P. 6-1)
   - Right and left side covers (P. 7-1)

2) Disconnect the fuel tube from the fuel tank, and remove the fuel filter.

3) Remove any foreign material from the fuel filter, and check the fuel filter for damage. Replace the fuel filter if necessary.

4) Remove the fuel tank, clean it with cleaning solvent, and allow the fuel tank to dry thoroughly.

5) After cleaning, install the fuel tank and set the fuel strainer in the tank. Connect the fuel tube.

6) Install the removed parts in the reverse order or removal.

7) Fill the fuel tank with gasoline, and check the fuel tube for gasoline leakage.

8. FUEL TUBE/FUEL PUMP/ DIAPHRAGM TUBE

**WARNING**

Gasoline is highly flammable and explosive.

You can be burned or seriously injured when handling fuel.

- Keep heat, sparks, and flame away.
- Handle fuel only outdoors.
- Wipe up spills immediately.

**Inspection/Replacement:**

1) Drain the fuel from the tank and carburetor, then remove the following parts.
   - Rear cover (P. 4-1)
   - Front cover and control panel (P. 6-1)
   - Right and left side covers (P. 7-1)
   - Left front frame (P. 7-3)
2) Check the fuel tube for deterioration, cracks and gasoline leakage.
   • If there is any abnormality in the fuel tube, replace the tube.

3) Check the diaphragm tube for deterioration, cracks and oil leakage.
   • If there is any abnormality in the diaphragm tube, replace the tube.

4) Check to see if water or foreign material are in the fuel pump.
   • If there is water or foreign material in the fuel pump, replace the pump.

5) After assembly, check for gasoline leakage from each part.

9. SPARK ARRESTER

Cleaning

⚠️ CAUTION
The engine and muffler become very hot during operation and they remain hot for a while after operation. Be sure that the engine is cool before muffler removal/installation.

1) Remove the four 6 mm special screws and rear cover.

2) Remove the three 6 mm flange bolts and muffler.

3) Remove the spark arrester from the muffler.
   Check for carbon deposits around the exhaust port and the spark arrester, and clean if necessary.

4) Use a brush to remove carbon deposits from the spark arrester screen.

   NOTICE
   Be careful to avoid damaging the screen.

   The spark arrester must be free of breaks and holes.
   Replace the spark arrester if it is damaged.

5) Reinstall the removed parts in the reverse order of removal.
1. MUFFLER

a. DISASSEMBLY/REASSEMBLY

- Muffler removal/installation must be performed with the engine cold.

**MUFFLER**

**INSTALLATION:**
Remove the carbon deposits by lightly tapping the outer flange with a plastic hammer before installation.

**SPARK ARRESTER**
Install after removing the carbon from the screen with a wire brush with care to avoid damaging the screen.

**REAR COVER**

**REASSEMBLY**
- Be sure that the rubber seal is set on the rear cover.
- Set the rubber seal on the rear cover by aligning the projection of the rubber seal with the groove in the rear cover as shown.

You can be burned or seriously injured when handling fuel.

- Keep heat, sparks, and flame away.
- Handle fuel only outdoors.
- Wipe up spills immediately.

Loosen the drain screw to drain the carburetor thoroughly before removal.

**NOTICE**

If the air cleaner removal/installation is made with the carburetor installed, hand tighten the two 5 mm flange nuts. Turn the choke lever fully closed position to prevent dust and dirt from entering the engine.

- Keep heat, sparks, and flame away.
- Handle fuel only outdoors.
- Wipe up spills immediately.

Loosen the drain screw to drain the carburetor thoroughly before removal.

**NOTICE**
- Cover the intake port with clean tape or film to prevent dirt from entering into the engine.
- If these parts are left out, dirt will enter the intake system.

**REASSEMBLY**
- After installing the motor cover, set against the clamp of the throttle control motor base securely.

**DISASSEMBLY/REASSEMBLY**
- Install the carburetor with the throttle valve at the full open position.

**SEALING WASHER**

**SET BOLT**
REASSEMBLY:
- Tighten the bolt securely and check for gasoline leakage.
**PILOT SCREW AND LIMITER CAP REPLACEMENT**

Leave the pilot screw and limiter cap in place during carburetor cleaning. Remove only if necessary for carburetor repair.

Removal of the limiter cap requires breaking the pilot screw. A new pilot screw and limiter cap must be installed.

1) When the limiter cap has been broken off, remove the broken pilot screw.

2) Place the spring on the replacement pilot screw, and install it on the carburetor.

3) Turn the pilot screw in until it is lightly seated; then turn the screw out the required number of turns.

| Pilot screw opening | 2 – 5/8 turns out |

4) Apply Locitite® 638 to the inside of the new limiter cap, then install the cap so its stop prevents the pilot screw from being turned counterclockwise.

Be careful to avoid turning the pilot screw while installing the limiter cap. The pilot screw must stay at its required setting.

**THROTTLE STOP SCREW**

Install the throttle stop screw after installing the pilot jet.

1) Install so that the throttle valve is at the full close position and the screw end does not come out of the bracket.

2) Start the engine, turn the ECO throttle switch on. Wait until the engine warms up.

3) Turn the throttle stop screw in until the engine speed starts to increase; then turn the screw out 3/5 turns.
c. INSPECTION

- FLOAT LEVEL HEIGHT

With the carburetor in an upright position, measure the distance between the float top and carburetor body when the float just contacts the float valve.

| Standard float height | 12.0 mm (0.47 in) |

If the height is outside the specification, replace the float. Check the float operation.

- THROTTLE CONTROL MOTOR

Measure the resistance between the terminals.

| Standard resistance | Between 1 and 3: 50 – 70 Ω | Between 2 and 4: 50 – 70 Ω |

If the resistance is outside the specification, replace the throttle control motor.

Operation check:
Start the engine and stop it. Be sure that the throttle control motor functions and the carburetor throttle arm moves properly.

- At start: Returns from the full open position to the full close position.
- At stop: Returns to the full open position.

If the throttle control motor does not operate properly, replace.
1. CONTROL PANEL

a. REMOVAL/INSTALLATION

1) Disconnect the connectors from the inverter unit and the generator wire harness.
2) Remove the control panel from upper side.
3) Remove the two composite socket terminals and the AC receptacle terminals.

1. GENERATOR

a. DISASSEMBLY/REASSEMBLY

1) Remove the rear cover (P. 4-1).
2) Remove the front cover and the control panel (P. 6-1).
3) Remove the right and left side covers (P. 7-1).
4) Remove the fuel tank (P. 7-2).
5) Remove the front frames and under cover (P. 7-3).
6) Remove the recoil starter and fan cover (P. 8-1).

COOLING FAN
DISASSEMBLY/REASSEMBLY:
Take care not to break the fan blades.

ROTOR
INSTALLATION:
Remove oil and contamination from the tapered part before installation.

WOODRUFF KEY
REASSEMBLY:
• Do not forget to install.
• After installing the rotor, be sure that the key is set properly.

CRANKSHAFT
REASSEMBLY:
Remove oil and contamination from the tapered part before installation.
• ROTOR REMOVAL

1) Remove the ignition pulse generator (P. 9-1).

2) Holding the rotor on the corner with a commercially available strap wrench, remove the two 6 x 16 mm flange bolts, and remove the recoil starter pulley, cooling fan set plate and cooling fan.

3) Holding the rotor on the corner with a commercially available strap wrench, remove the 12 mm flange nut.

   **NOTICE**

   *Do not try to remove the nut by striking it with a hammer or equivalent tool.*

4) Remove the rotor using the flywheel puller.

• ROTOR INSTALLATION

1) Remove the dust and oil from the tapered part of the crankshaft and rotor.

2) Set the woodruff key in the key groove securely.

3) Install the rotor on the crankshaft. Check to see whether the magnetic part of the rotor is free from metallic particles, washers, etc.

4) Holding the rotor on the corner with a commercially available strap wrench, tighten the 12 mm flange nut to the specified torque.

   **TORQUE: 51 N·m (5.2 kgf·m, 37.6 lbf·ft)**

5) Install the cooling fan, cooling fan set plate and recoil starter pulley.

6) Holding the rotor on the corner with a commercially available strap wrench, tighten the two 6 x 16 mm flange bolts.

7) Install the ignition pulse generator.
b. INSPECTION

• IGNITION PULSE GENERATOR

Measure the resistance between the terminals A and B shown.

| Resistance | 300 – 360 Ω |

• STATOR

Exciter coil:
Measure the resistance between the black/blue terminal and stator core.
• If the resistance is measured with stator mounted on the generator, disconnect the small 6P connector, measure the resistance between the black/blue terminal and the green terminal.

| Resistance | 0.2 – 0.3 Ω |

If the resistance is out of the specification, inspect the generator wire harness. Replace the generator wire harness if necessary.

If the generator wire harness is normal, replace the stator assembly.

Sub coil:
Measure the resistance between the orange and gray terminals of the big 6P connector.

| Resistance | 0.1 – 0.2 Ω |

If the resistance is outside the specification, inspect the generator wire harness. Replace the generator wire harness if necessary.

If the generator wire harness is normal, replace the stator assembly.

AC coil:
Measure the resistance between the red, white and blue terminals of the big 6P connector.

| Resistance | Red – white: 1.4 – 1.5 Ω  
Red – blue: 1.4 – 1.5 Ω  
White – blue: 1.4 – 1.5 Ω |

If the resistance is out of the specification, inspect the generator wire harness. Replace the generator wire harness if necessary.

If the generator wire harness is normal, replace the stator assembly.
DC coil:
Measure the resistance between the terminals of the 4P connector.

| Resistance | 0.1 – 0.2Ω |

If the resistance is out of the specification, inspect the generator wire harness. Replace the generator wire harness if necessary.

If the generator wire harness is normal, replace the stator assembly.

• IGNITION PULSE GENERATOR-TO-ROTOR CLEARANCE
Insert a feeler gauge between the ignition pulse generator and the rotor projection and inspect the air gap.

| Air gap | 0.2 – 0.7 mm (0.008 – 0.028 in) |

• HEAD COVER

REMOVAL:
1) Remove the four 6 x 28 mm flange bolts.

2) To remove the head cover, insert a screwdriver or equivalent tool into the cylinder recess as shown. Remove the head cover slowly.

• Clean up any spilled engine oil with a shop towel when removing the head cover.

NOTICE

• Do not remove the head cover with force, because that can deform the head cover.
• Replace the head cover if it is deformed.

INSTALLATION:
1) Clean the mating surfaces of the head cover and the cylinder using a degreasing cleaning agent or a clean shop towel.

2) Apply a 1.5 – 2.0 mm (0.06 – 0.08 in) diameter bead of liquid gasket (Hondabond #4, ThreeBond #1207B or equivalent) to the cylinder block. Specifically, to the inner wall of the groove and bolt holes in the cylinder block.

Assemble within 10 minutes after applying the liquid gasket.

3) Wait for approximately 20 minutes after assembly before filling with oil and starting the engine.

• CAM PULLEY

REMOVAL:
1) Remove the spark plug and head cover.

2) Put the piston at top dead center (TDC) of the compression stroke where both valves are fully closed. The top dead center of the compression stroke is in the position where the head cover mating surface is in line with the cam pulley alignment marks.

3) Remove the intake and exhaust rocker arms and the rocker arm pins (P. 10-1).

Remove the cam pulley shaft from the cam pulley (P. 10-1).
4) Push the cam pulley into the cylinder a little. Detach the timing belt from the flange side of the cam pulley as shown, and remove the cam pulley.

**INSTALLATION:**

1) Put the piston at top dead center (TDC) of the compression stroke where both valves are fully closed. Align the starter pulley alignment point with the fan cover "▲" mark.

The top dead center of the compression stroke is in the position where the head cover mating surface is in line with the cam pulley alignment marks.

2) Set the timing belt on the cam pulley from the flange side of the cam pulley.
3) Align the alignment marks on the cam pulley so that they are in line with the head cover mating surface.

The top dead center of the compression stroke is in the position where the head cover mating surface is in line with the cam pulley alignment marks.

Be careful to avoid turning the crankshaft when installing.

4) Apply oil to the 6.8 x 1.9 mm O-ring and install it on the cam pulley shaft (P. 10-1).

5) Install the cam pulley shaft in the cylinder (P. 10-1).

6) Holding the cam pulley alignment marks in line with the head cover mating surface, check again whether the piston is at the top dead center of the compression stroke.

7) If the alignment marks and the head cover mating surface are out of alignment or if the piston is not at the top dead center of the compression stroke, repeat the procedure from the step 1 (P. 10-3).

- **ROCKER ARM SHAFT**

**INSTALLATION:**
Install the rocker arm shaft from the opposite side of the cam pulley as shown.
2. CRANKCASE COVER/CRANKSHAFT/CYLINDER BLOCK

a. REMOVAL/INSTALLATION

Remove the cam pulley and rocker arm (P. 10-1).

**CRANKCASE COVER ASSEMBLY**

**REMOVAL:**
1) Remove the eight 6 x 25 mm flange bolts.
2) Insert a screw driver or equivalent tool into the recess as shown, and remove the crankcase cover from the cylinder block.

**6204 RADIAL BALL BEARING**

**REMOVAL:**
Pull the bearing off the crankshaft, using a commercially available bearing puller.

**INSTALLATION:**
1) Apply oil to the circumference of a new radial ball bearing.
2) Press the radial ball bearing onto the crankshaft, using the special tools.

• PISTON ASSEMBLY/CONNECTING ROD CAP

INSTALLATION:
• When the piston and connecting rod are disassembled, check that the piston is properly assembled with the connecting rod. Assemble the piston and connecting rod properly if necessary (P. 10-11).
• Perform the following after checking that the piston and connecting rod are installed properly.

1) Apply oil to the inner wall of the cylinder, outer surface of the piston and to the inner wall of the connecting rod big end.

2) Install the piston assembly in the cylinder block with the cam pulley mounting part toward up. Be sure that the "▼" mark of the "FW ▼" mark on the piston skirt inside points down (toward the flywheel) when the longer side of the connecting rod long end is facing to the right as shown.

The piston must be at the top dead center of the compression stroke.

• Take care not to break the piston ring when installing the piston assembly in the cylinder.

3) Apply oil to the crank pin and journal.

4) Install the crankshaft in the cylinder block (P. 10-5).

5) Apply oil to the connecting rod cap bearing.

6) Install by aligning the alignment marks on the connecting rod big end and connecting rod cap.

7) Apply oil to the threaded part and seat of the connecting rod bolts. Tighten the connecting rod bolts to the specified torque.

TORQUE: 5 N-m (0.5 kgf·m, 3.6 lbf·ft)
• 20 x 32 x 6 mm OIL SEAL

INSTALLATION:
• Cylinder block side
1) Apply oil to the outside of the new oil seal.
2) Install the new oil seal on the cylinder block using the special tools as shown.

TOOLS:
Driver 07749-0010000
Attachment, 32 x 35 mm 07746-0010100
Pilot, 20 mm 07746-0040500
3) After installation, apply grease to the lip.

• CRANKSHAFT/CYLINDER BLOCK/TIMING BELT/6 X 25 mm FLANGE BOLT

INSTALLATION:
1) Install the piston/connecting rod assembly in the cylinder block (P. 10-5).
2) Align the "Ⅲ" mark on the cylinder block with the "Ⅲ" mark on the crankshaft.
3) Set the timing belt on the timing belt drive pulley so that the marks on the timing belt is upside down as shown.
4) After installing the timing belt, install the respective cam pulley (P. 10-3).
5) Clean the mating surface of the cylinder block and the crankcase cover using a degreasing cleaning agent or a clean shop towel.

6) Set the 8 x 20 mm dowel pins on the cylinder block.

7) Apply a 1.5 – 2.0 mm (0.06 – 0.08 in) diameter bead of liquid gasket (HondaBond #4, ThreeBond #1207B or equivalent) to the cylinder block. Specifically, to the crankcase cover mating surface.

8) Install the crankcase cover on the cylinder block.
   • Assemble within 10 minutes after applying the liquid gasket.
   • If it is hard to install the crankcase cover securely, assemble by turning the crankshaft a little.

9) Hand tighten each 6 x 25 mm flange bolt, then tighten to the numbered sequence.

10) Wait for approximately 20 minutes after assembly before filling oil and starting the engine.
3. PISTON

**TOP RING**

**REASSEMBLY:**
Chrome plated. Do not interchange with SECOND RING

**MAKER MARK**

**"N" MARK**

**SECOND RING**

**OIL RING**

**REASSEMBLY**
- Space the side rail end gaps at least 20 mm (0.8 in) apart.
- Coat the oil ring with oil after assembly.

**PISTON RINGS**

**INSPECTION:** P. 10-20

**REASSEMBLY:**
- Install with the mark facing upward as shown.
- Do not interchange the top ring and the second ring.
- After assembly, check for smooth movement of the piston ring.
- Stagger the piston ring end gaps 120° apart.

Do not align with piston pin.

**PISTON PIN**

**INSPECTION:** P. 10-20

**PISTON PIN CLIP (2)**

**REASSEMBLY:**
Set one end of the clip into the groove in the piston and work the other end around in the groove using a pair of needle nosed pliers. Install so that the end gap does not face the notch in the piston.
• PISTON/CONNECTING ROD

REASSEMBLY:
1) Apply oil to the piston pin hole and the connecting rod small hole.

2) Install the connecting rod in the piston so that the "ZOD" mark on the piston head points down when the connecting rod long end is facing to the right as shown.

3) Apply oil to the piston pin and install it in the piston.

4) Install new piston pin clips.

5) Install the piston/connecting rod assembly in the cylinder block. (P. 10-7).
4. VALVES

a. DISASSEMBLY/REASSEMBLY

Remove the crankcase cover, crankshaft and cylinder barrel (P. 10-5).

VALVE SPRING RETAINER

DISASSEMBLY:
Push down and slide the retainer to the side, so the valve stem slips through the hole at the side of the retainer.

Do not remove the valve spring retainer while the piston is installed, or the valves will drop into the cylinder.

SPARK PLUG

INSPECTION/CLEANING:
P. 3-5
Standard spark plug:

IDENTIFICATION MARK:
"DI" is stamped on the valve head.

EXHAUST VALVE

REASSEMBLY:
Do not interchange with the intake valve. Before installation, remove carbon deposits and inspect the valve.

INSPECTION: P. 10-22
VALVE HEAD DIAMETER:
21 mm (0.8 in)

IDENTIFICATION MARK:
"DE" is stamped on the valve head.

• CYLINDER BLOCK

COMBUSTION CHAMBER CLEANING:
1) Prepare a cylinder of thick paper or equivalent material, with a diameter large enough to fit against the inner wall of the cylinder, and insert it into the cylinder for protection.

2) Attach the cleaning brush (special tool) to an electric drill and clean the combustion chamber.

TOOL:
Cleaning brush 07998-VA20100

NOTICE
• Be sure to insert thick paper into the cylinder to protect the inner wall of the cylinder during cleaning of the combustion chamber.
• Do not press the cleaning brush with force against the combustion chamber.

- **OIL LEVEL SWITCH**

**INSTALLATION:**
1. Install the oil level switch (P. 10-14).
2. Set the oil level switch wire between the ribs of the cylinder block as shown.
6. INSPECTION

- OIL LEVEL SWITCH

Check continuity between the yellow wire and ground with an ohmmeter.

1) Hold the switch in its normal position. The ohmmeter should read zero resistance.

2) Hold the switch upside down. The ohmmeter should read infinite (∞) resistance.

3) Inspect the float by dipping the switch into a container of oil. The ohmmeter reading should go from zero to infinity as the switch is lowered.

- 6204 RADIAL BALL BEARING

Turn the inner race of the bearing with your finger. The bearing should turn smoothly and quietly. Also check that the bearing outer race fits in place.

Replace the bearing if the inner race does not turn smoothly, quietly, or if it fits very loosely.

- CAM PULLEY

DECOMPRESSOR WEIGHT INSPECTION:
Before installing, inspect for a worn or weakened spring, and check that the decompressor weight moves smoothly.

If the stem-to-guide clearance exceeds the service limit, determine if the new guide with standard dimensions would bring the clearance within tolerance. If so, replace any guide as necessary and ream to fit. If the stem-to-guide clearance exceeds the service limit with new guides, replace the valves as well.

Recondition the valve seats whenever the valve guides are replaced (P. 10-26).

• VALVE SEAT WIDTH

Measure the valve seat width. Apply Prussian Blue compound or erasable felt-tipped marker ink to the valve faces. Insert the valves, and then lift them and snap them closed against their seats several times. Be sure the valve does not rotate on the seat. The seating surface, as shown by the transferred marking compound, should have good contact all the way around.

If the valve seat width is under the standard, or over the service limit, or if the valve seat is too high/low, recondition the valve seat (P. 10-26).
7. VALVE GUIDE REPLACEMENT

1) Chill the replacement valve guides in the freezer section of a refrigerator for about an hour.

2) Use a hot plate or oven to heat the cylinder block evenly to 150 °C (300 °F). Check the temperature with a temperature indicating stick (available at welding supply store) or equivalent.

**NOTICE**
- Do not use a torch to heat the cylinder block; warpage of the cylinder block may result.
- Do not get the heat hotter than 150 °C (300 °F); excessive heat may loosen the valve seats.

3) Remove the heated cylinder block from hot plate, and support it with wooden blocks. Wear heavy gloves to protect your hands.

4) Drive the valve guides out the cylinder block from the combustion chamber side.

**TOOL:**
Valve guide driver, 3.6 x 8.0 mm 07JMD-KY20100

**NOTICE**
Be careful to avoid damaging the cylinder block when driving out the valve guides.

5) Allow the cylinder block to cool to room temperature. Clean and inspect the valve guide bores in the cylinder block. Wash out any foreign material.

6) Use a hot plate or oven to heat the cylinder block evenly to 150 °C (300 °F). Check the temperature with a temperature indicating stick or equivalent.

7) Install the new valve guides from the valve spring side of the cylinder block.

**TOOL:**

Exhaust side: Drive the exhaust valve guide until the clip is fully seated as shown.
Intake side: Drive the intake valve guide to the specified height, measured from the top of the valve guide to the cylinder block casting as shown.

8) After installation, inspect the valve guides for damage. Replace any damaged valve guide.
• VALVE GUIDE REAMING

For best results, be sure the cylinder block is at room temperature before reaming valve guides.

1) Coat the reamer and valve guide with cutting oil.

2) Rotate the reamer clockwise through the valve guide for the full length of the reamer.

3) Continue to rotate the reamer clockwise while removing it from the valve guide.

   TOOL:
   Valve guide reamer, 4.008 mm 07MMH-MV90100

4) Thoroughly clean the cylinder block to remove any cutting residue.

5) Check the valve guide bore; it should be straight, round and centered in the valve guide, insert the valve and check operation. If the valve does not operate smoothly, the guide may have been bent during installation. Replace the valve guide if it is bent or damaged.

6) Check the valve guide-to-stem clearance (P. 10-23).
8. VALVE SEAT RECONDITIONING

1) Thoroughly clean the combustion chamber and valve seats to remove carbon deposits (P. 10-13).

2) Apply a light coat of Prussian Blue compound or erasable felt-tipped marker ink to the valve faces.

3) Insert the valves, and then lift them and snap them closed against their seats several times. Be sure the valve does not rotate on the seat. The transferred marking compound will show any area of the seat that is not concentric.

**NOTICE**

*Follow the valve seat cutter manufacturer’s Instructions.*

4) Using a 45° cutter, remove enough material to produce a smooth and concentric seat.

Turn the cutter clockwise, never counterclockwise. Continue to turn the cutter as you lift it from the valve seat.

**TOOLS:**
(Special tools or equivalent commercially available)
- Valve seat cutter, 45° 24.5 mm (IN) 07780-0010100
- Valve seat cutter, 45° 24 mm (EX) 07780-0010600
- Valve seat cutter, 32° 25 mm (IN) 07780-0012000
- Valve seat cutter, 32° 24 mm (EX) 07780-0012500
- Valve seat cutter, 60° 24 mm (IN/EX) 070PH-Z0D0100
- Cutter holder, 4.0 x 400 mm 070PH-Z0D0200

5) Use the 32° and 60° cutters to narrow and adjust the valve seat so that it contacts the middle of the valve face.

The 32° cutter removes material from the top edge.
The 60° cutter removes material from the bottom edge.

Be sure that the width of the finished valve seat is within specification (P. 10-27).

</table>

6) Make a light pass with 45° cutter to remove any possible burrs at the edges of the seat.

7) After reconditioning the seat, inspect for even valve seating. Apply Prussian Blue compound or erasable felt-tipped marker ink to the valve faces. Insert the valves, and then lift them and snap them closed against their seats several times. Be sure the valve does not rotate on the seat. The seating surface, as shown by the transferred marking compound, should have good contact all the way around.

8) Lap the valves into their seats, using a 4 mm tube as shown and lapping compound (commercially available).

**NOTICE**

To avoid severe engine damage, be sure to remove all lapping compound from the combustion chamber before assembly.

9) Check valve clearance after assembly (P. 3-5).
1. INVERTER TYPE GENERATOR

CONSTRUCTION

The Inverter generator has an outer and an inner rotating set of magnets for both the generator and the ignition. The inner set of magnets generate AC in the stator windings, while the outer set generates AC for the ignition coil. A multi-pole coil is used on the stator (15 poles for the AC winding, 6 poles for the DC winding, 1 pole for the sub winding, and 1 pole for the exciter winding). The AC coil in the stator is picked up by the inverter.

Operating Principles

When the rotor rotates, the AC (3-phase) is generated at the AC main winding, which is converted into DC by the regulator/rectifier. The voltage is stabilized by the regulator/rectifier in the converter simultaneously. The AC generated at the sub winding becomes the power source for each circuit and elemental device, such as an inverter built-in power transistor. Getting a signal from the oscillator circuit, the inverter that controls the LED generates the AC (single phase) of the proper frequency.

• AC Overload Protection System

The power output indicator light (green LED) is on while the generator is running with normal load. When overloaded, the overload warning light turns on by getting signal from the output current detecting circuit to indicate overloading. When the generator runs overloaded for more than 5 seconds, the circuit cuts off the AC to protect the generator. When the output is cut off due to overloading, stop the engine and disconnect the attached electrical device from the generator to remove the load. Start the engine again. The LED (green) should turn on.
2. FULL TRANSISTOR IGNITION

Operating Principles

The positive (+) and negative (-) power sources are provided from the exciter winding. AC current is provided to the Ignition coil from the negative (-) power source. Current switching to the ignition coil is controlled by the Field Effect Transistor (FET).

The FET turns on when the pulse pole front end reaches the ignition pulse generator and starts to amplify the current in the ignition coil primary winding. The FET turns off when the pulse pole back end has passed the ignition pulse generator, which stops the current in the ignition coil primary winding. The high voltage is then generated in the ignition coil secondary winding (ignition point).

- **Rev Limiter**

The engine is equipped with a rev limiter to protect the generating system from excessive engine speed. The rev limiter receives its signal from the ignition pulse generator. If the engine speed reaches a predetermined level, the rev limiter will be activated and will cut off the ignition system.

- **Oil Alert® System**

The Oil Alert® unit will cut off the ignition system when the engine oil falls to a predetermined level by turning on the oil level switch and the red light emitting diode (LED), which acts as a warning light. The red LED will remain lit approximately two seconds after engine stops using electrical energy from the condenser in the ignition control module.

- **Electrical Source**

The engine is operated by the dual electrical source: the positive (+) half-wave and the negative (-) half-wave. The diodes convert AC that is generated at the exciter winding to the positive (+) half-wave and the negative (-) half-wave AC currents. The positive (+) half-wave becomes the power source for the rev limiter while the negative (-) half-wave becomes the power source for the ignition system and the Oil Alert® unit. Both of the half waves become the power source for the FET gate drive. This system realizes a stable rev limiter activating condition and a Field Effect Transistor (FET) ignition system.
3. ECO-THROTTLE (ELECTRICAL GOVERNOR)

Operating Principles

- Variable Engine Speed
The inverter’s CPU compares the current output voltage, current and engine speed with what is programmed in its memory and sets the throttle position accordingly. The actual required engine speed then is based on generator load ratio and temperature. As a load is applied, the engine speed, generator output power will drop momentarily. The inverter will calculate the type of load (how much of power drop is occurring) and set the engine speed accordingly.

- Engine Stall Prevention System
Detecting the engine load by the throttle opening the system prevents engine speed from going down when the load is excessively high, beyond engine load capacity by controlling the output voltage at the inverter. This system is able to generate maximum power more efficiently, and control peak performance for applications that require more electric power, such as motors. The system automatically activates higher engine speeds in order to compensate for the power loss of the engine when used in the high altitude or deterioration if the generator caused over time.
INTRODUCTION

This supplement covers service and repair procedures for Honda EU2000i Companion (AC1 (California), AN1 (Non-California) types) generators.

All information contained in this manual is based on the latest product information available at the time of printing. We reserve the right to make changes at any time without notice.

No part of this publication may be reproduced, stored in a retrieval system, or transmitted, in any form by any means, electronic, mechanical, photocopying, recording, or otherwise, without prior written permission of the publisher. This includes text, figures, and tables.

As you read this manual, you will find information that is preceded by a [NOTICE] symbol. The purpose of this message is to help prevent damage to the generator, other property, or the environment.

SAFETY MESSAGES

Your safety and the safety of others are very important. To help you make informed decisions, we have provided safety messages and other safety information throughout this manual. Of course, it is not practical or possible to warn you about all the hazards associated with servicing these generators. You must use your own good judgement.

You will find important safety information in a variety of forms, including:

- **Safety Labels** – on the generator.

- **Safety Messages** – preceded by a safety alert symbol and one of three signal words: DANGER, WARNING, or CAUTION.

  These signal words mean:

  - **DANGER** You WILL be KILLED or SERIOUSLY HURT if you don't follow instructions.

  - **WARNING** You CAN be KILLED or SERIOUSLY HURT if you don't follow instructions.

  - **CAUTION** You CAN be HURT if you don't follow instructions.

- **Instructions** how to service these generators correctly and safely.

Over the years of running a mobile RV repair service, having a dedicated place to access service manuals for all the different appliances and components found on RVs was something that I always had a desire to create.

I hope this resource makes your RV repairs easier, as it has mine, but please be careful and follow proper safety practices when attempting to repair your own RV.

If in doubt, please consult with a professional RV technician!
